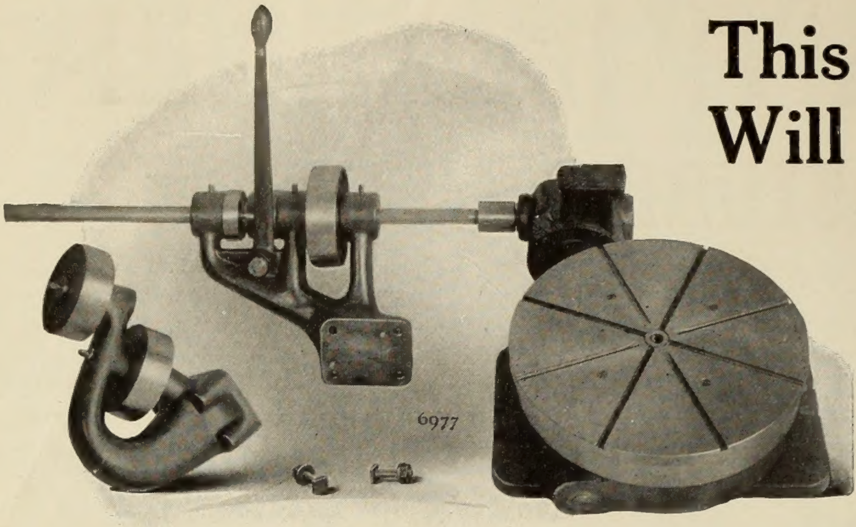
A. B. JARDINE & CO., HESPELER, ONTARIO, CAN.

This Combination Will Handle all of Your Surface Grinding

The combination of rotary and rectangular reciprocating chucks furnished especially on the

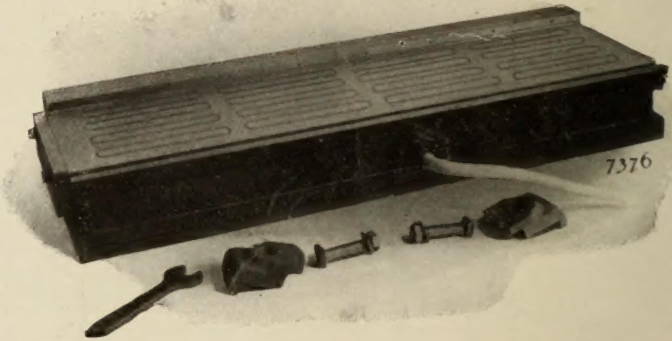
P & W Vertical Service Grinder

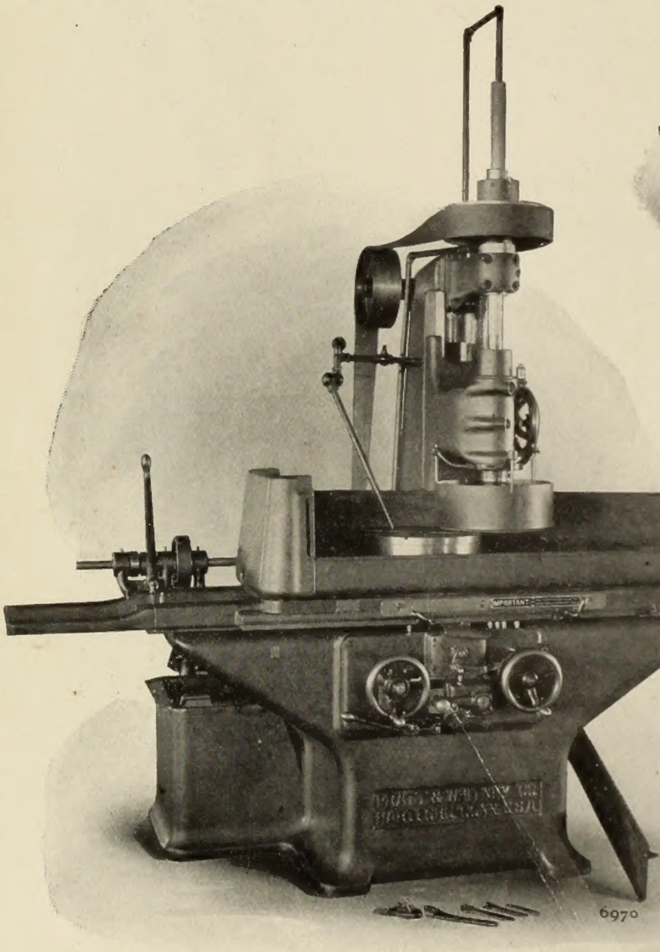
enables you to grind all of your various types of flat work with the best finish, highest degree of accuracy and greatest economy.



Both Chucks Furnished of the Magnetic Type

The rectangular chuck is regularly furnished of the magnetic type and the rotary chucks either plain or magnetic. This is the simplest and most efficient method of holding the work.





Rotary Chucks Most Efficient on Circular Work

Your circular work such as gear blanks, washers, rings, discs, etc., can be most efficiently handled by the rotary chucks, a single piece being placed at the centre of the chuck.

We furnish single, double and quadruple chucks, depending on the output you wish to make on each machine. The single and double rotary chucks can be tilted to an angle for concave and convex work.

Rectangular Reciprocating Chucks For Other Flat Work

For the rest of your work, the rotary chuck is readily removed and the rectangular chuck substituted.

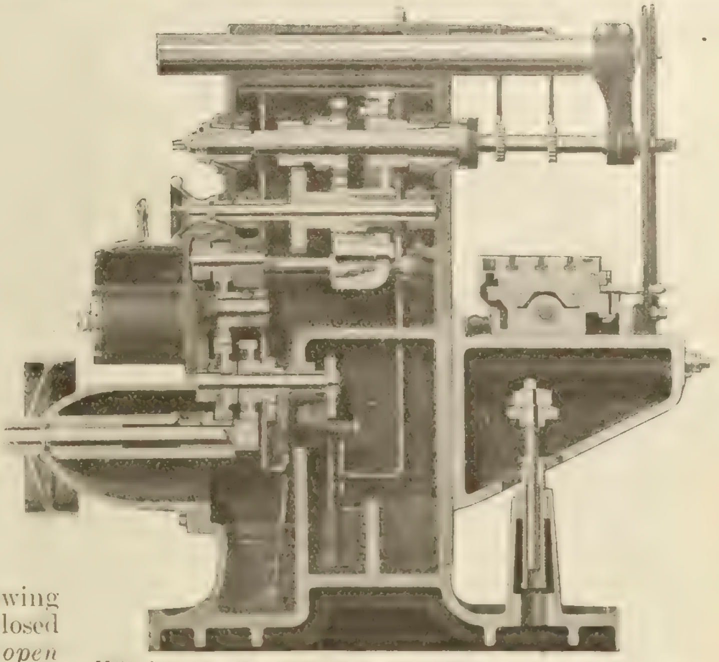
Running Oil
versus
Stagnant Oil
for lubrication of
moving bearings

Look at the cross section of the

MILWAUKEE MILLING MACHINE



Oil is pumped automatically to the perforated pipe shown just under the over-arms and cascades down over the whole series of shafts and gears contained in this main frame, keeping them drenched in *running* oil. Pockets are arranged for lubricating spindle bearings and these are kept overflowing with fresh oil. Oil grooves instead of being closed at the ends to retain oil (and grit) are left *open* so the oil will flow continuously and carry grit or other trouble-makers with it.

A second pipe carries oil to the arbor outside the frame, and this oil is caught by the table and drained back into the reservoir.

Efficient *automatic* lubrication means much on a milling machine. Our automatic flooded lubrication, plays no small part in the preference of well-posted machinists for the Milwaukee Miller.

For Your Big Jobs

For your big jobs you need a micrometer which will give you as accurate results as the ordinary micrometer does on small work. You need a micrometer which will quickly give any size between one and six inches without turning the handle through the whole distance. You need a micrometer that you can rely on. The tool that fills these needs is the

Starrett Government Micrometer

It was made to suit the requirements of the Ordnance Department of the United States Government and many of them are now doing service there.

The micrometer frame is cut from steel plate and is covered with hard rubber to prevent expansion from the warmth of handling. The micrometer adjusts one inch reading 1-1000 of an inch Tail spindles, forming anvils are provided, and these may be quickly adjusted to the micrometer, making it possible to measure anything between one and six inches without turning the spindle more than one inch. The adjusting collars on these anvils have notches to facilitate the removing of dirt which might prevent them from setting accurately against the seat. This is the ideal micrometer for general tool room service.

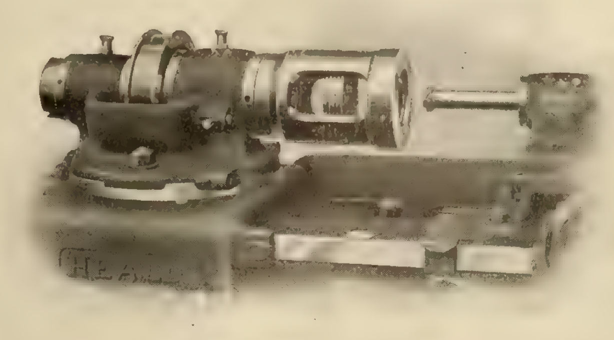
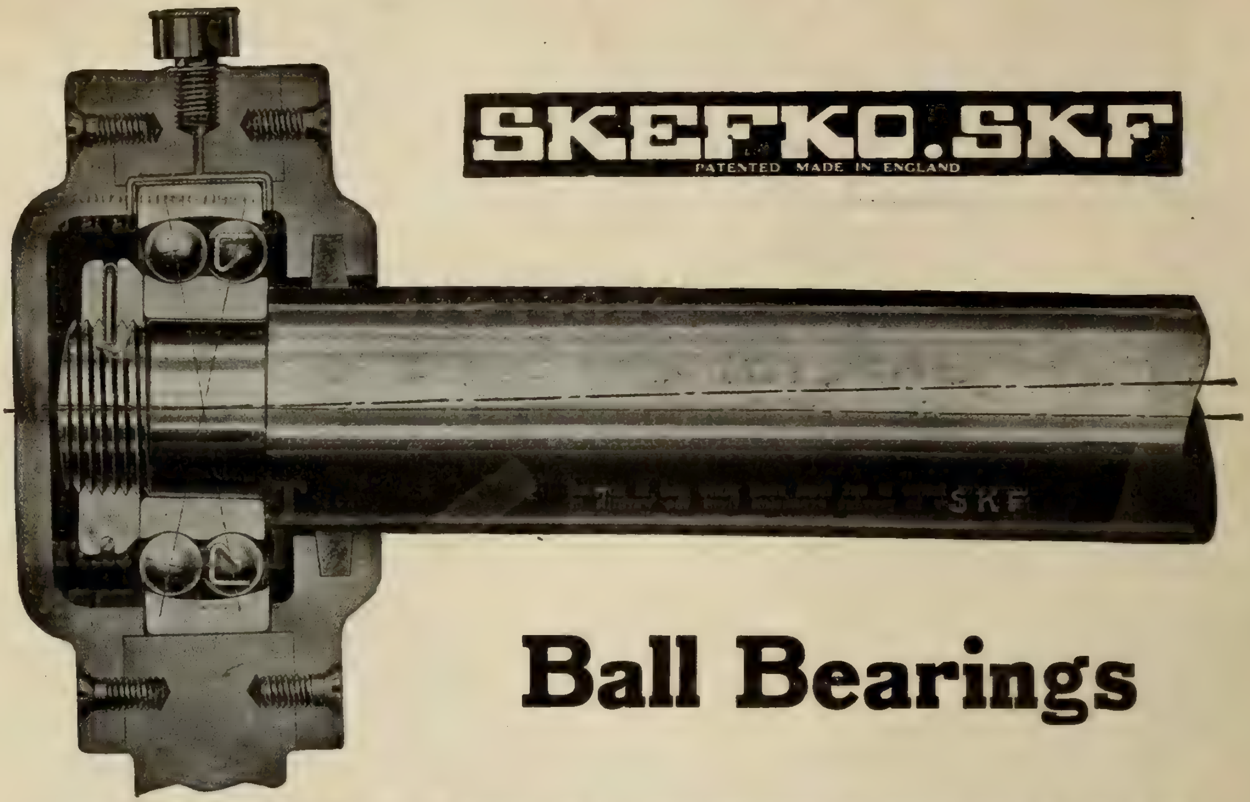
THE HEALD MACHINE CO.
8 New Bond Street Worcester, Mass.





SKEFKO.SKF
PATENTED MADE IN ENGLAND

Ball Bearings

Every feature in a SKEFKO Bearing has been worked down to the closest possible refinement, embodying simplicity, ruggedness, accuracy and the greatest load-carrying capacity. No parts can work loose, rattle or cause bearing failure. The retainer is but one piece of Swedish Lancashire Steel. It performs *right* and is proof against trouble. Moreover, it will not collect grit or other harmful matter.

SKEFKO is the only truly self-aligning bearing. This feature alone is worth most careful consideration.

The outer ball race is machined and ground to a radius struck from the centre of the bearing. The inner race is provided with two grooves, ground slightly larger than the radius of the balls. The balls, cage and inner race, retain precisely the same spacing with reference to each other at all times, and rotate as a unit within the spherical surface of the outer race. The whole constitutes a practically perfect ball and socket joint, capable of adjusting itself instantly and automatically to any spring of the shaft upon which it is mounted. Absolutely no cramping strains can be introduced on the balls, and the permissible arc of deflection covers a range that would instantly destroy a bearing of any other type.

Time and again automatic self-alignment, as obtained exclusively by this construction, has brought success with SKEFKO Bearings where rigid bearings had failed utterly.

SKEFKO Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more and are made in international standard sizes. Their use is practical under any speed and load condition, and the lubrication and protective housing can be made to conform to any service requirements.

SKEFKO are the recognized standard and are replacing other constructions in many types of machinery.

Our literature explains these matters in detail. Your best interests demand that you investigate. Tell us your bearing troubles and ask for our bulletins.

Data Relative to the Use of Producer Gas in Brass Melting

By M. Herr

The information contained in the accompanying article is worthy the attention and consideration of all engaged in brass foundry work, giving as it does, a clear and unbiased statement of achievement realized from practical operation.

ABOUT five years ago, after very exhaustive and costly experimenting, the double flow producer for bituminous fuel was pronounced a success, placed on the market and the first commercial plant, consisting of three 175 horse-power units, was installed.

When we were experimenting with producers, we found that a certain temperature in the fuel bed resulted in the production of more or less tar, and by noting the temperature, we were enabled to guard against a recurrence thereof. In the field we found that it was impracticable to try to teach an operator the significance of individual items of this character, so we simply show him the color of the proper fire on top and say, "Keep it looking that way." We have adopted a language that he can understand, but haven't told him anything about tar at all. We learned that gas clean enough for engine work was still objectionable for continuous operation, due to the deposit of lamp black at the elbows and turns in the piping. It became necessary, therefore, to still further purify the gas, particularly for installations where much small piping was used. Our present practice is to supply dry scrubbers with all equipment, as an auxiliary cleaning device to the static washer. This dry scrubber is installed in such a way that it can be cleaned during operation by by-passing the gas around it for a short period.

The value of the use of producer gas for fuel purposes has long been realized by steel makers, and, as we all know, gas has been used for years in the steel industry. Its progress in the industrial field for small work has been slow, first because there were no producers on the market that would make from bituminous coal a gas clean enough to permit of its being satisfactorily conducted through small permanent pipes, and second, due to the very low price of fuel oil and the small expense incident to its use.

Industrial Plants.

The first industrial plant attempted by us was a little plant at Baltimore, where it was impracticable to use oil on account of the small quantities required for the individual furnaces. The previous practice had been to use city gas. At the plant in question buttons and buckles are manufactured, and the gas is used for lacquering and enameling them. The temperatures are low, and producer gas is the ideal fuel. A very noticeable saving in fuel cost was shown. The plant has been operating for three years without trouble, and the owners are always glad to show it to any one interested in producer gas work. It might be interesting to know that this plant was operated for practically three years, and the fire was never out during that time.

Another application made is in a plant in which a 250 horse-power producer furnishes gas for tempering and hardening rollers for bearings. This is also small furnace work, and requires temperatures of from 1,600 to 1,800 degrees F. The plant was started, and all of the 16 or 18 furnaces rigged up and placed in commercial service in approximately two months. No further instructions in the operation of the plant have become necessary, and it has been operating about sixteen months effecting a saving of approximately $500 per month.

Data Relative to Brass Melting.

About three years ago Mr. Wm. Langsenkamp, a well-known foundryman of Indianapolis, Ind., called our attention to the problem of melting brass by the use of producer gas. At that time a 250 horse-power producer was being installed by us at the Langsenkamp plant (this producer), replacing an anthracite plant for power work. During the past year this unit has been replaced by a plant consisting of four units of 350 horse-power capacity each, making a total of 1,400 horse-power. The gas is used for power, baking cores and brass melting. We believe it is the most advanced producer gas plant in the country, and one of high commercial interest at this period of unrest on the oil question.

An average sample of city gas was taken, and its analysis made on a percentage basis. The same was done with producer gas. The heat units in a 100 cubic foot of city gas were calculated, and the quantity of producer gas containing the same number of heat units was determined. The weights of the various constituents of these two quantities of gas were then calculated, and the weight of air necessary for complete combustion determined.

Assuming complete combustion, the weights of the burnt gases escaping from the furnace were computed. From these results, and the specific heats of the products of combustion, the quantities of heat carried away from the furnace in the exhaust gases per degree, difference of temperature between inlet and exhaust were computed. This loss was then determined for various differences between inlet and outlet temperatures. To these amounts the loss due to the latent heat of steam formed during combustion was added, and the total loss subtracted from the original heat input.

This gave the quantity of heat available for heating the furnace at various temperature differences between inlet and outlet gas, both for city gas and producer gas. A curve was then plotted, from which, if the quantity of city gas heat units required to heat the furnace were known, the amount of producer gas heat units to do the same work may be read. It was observed that in each instance it requires more producer gas heat units than city gas heat units to maintain a given temperature. The reason for this is the fact that about 50 per cent. of producer gas by volume is nitrogen, and 10 per cent. by volume is carbon dioxide, both being inert gases.

It would be possible to plot a similar curve showing the comparison of fuel oil and producer gas. This, however, has not been done, for the reason that, in the first place, it is so difficult to procure a good chemical analysis of fuel oil, and, in the second place, we believe such a curve would approximate the one for city gas. The reason for this latter belief is that the added quantity of producer gas required in furnace operation is due to the presence of inert gases, as cited.

The excess loss in the case of producer gas increases with increasing furnace temperatures. To counteract this, steel makers build stoves through which the exhaust and inlet gases are alternately passed. To accomplish the same result, and at the same time to make the operation continuous, we have passed the inlet gas and air through the pipes, and allowed the exhaust gases to play on these pipes. This is our preheating arrangement for brass melting by which the inlet temperatures are increased, and the difference between the inlet and outlet temperatures become less, thereby reducing the heat loss in the exhaust.

Test Run Data.

From a test run of five days at Langsenkamp's, it was found that it required an average of 140 pounds of coal to melt 200 pounds of brass. Allowing 10 per cent. for stand-by losses in the producer, the actual coal consumption per heat is 126 pounds. Coal of 14,000 heat units per pound was used, and on a basis of 72 per cent. producer efficiency, there were available from each pound of coal 10,080 B.t.u. in gas. It, therefore, requires 126 multiplied by 10,080, or 1,270,080 B.t.u. in producer gas to melt 200 pounds of brass. The pre-heat obtained was approximately 700 degrees F, and the furnace temperature approximated 2,400 degrees F, giving a difference of temperatures between the inlet and outlet gases of 1,700 degrees F.

With this difference of inlet and outlet temperatures, it requires 1.34 times as many producer gas heat units as illuminating gas or oil heat units. Therefore, dividing 1,270,080 by 1.34, we obtain 947,820 heat units necessary to do this same work with oil fuel. On a basis of oil of 19,000 heat units per pound, and 6½ pounds per gallon, and an average of 7.4 gallons per heat of 200 pounds brass, we obtain 913,900 B.t.u., which figure agrees very closely with the above figure, 947,820, the difference being but 4 per cent. Seven and four-tenths gallons of oil per heat of 200 pounds brass is a good average figure for oil fuel operating between nine and ten hours a day.

This theory has been brought to your attention principally because of the great difficulty of convincing oil users who are accustomed to deal with small quantities of oil, of the large quantities of gas necessary to bring about corresponding results. Our estimates have been questioned time after time, and the foregoing analyses were made in order that we might have something tangible to justify our figures. The apparent excessive gas consumption has been attributed by some to improper burner design, but from the above analysis you will understand that such is not the case.

The practice of this plant is to use No. 70 crucible furnaces and operate ten hours a day. Owing to the fact that not only the furnaces, but also the preheater must be heated up each morning, the operating conditions are about the worst possible for a producer gas plant. If an economic advantage can be shown on this plant, certainly one can be shown on continuously operating plants.

From the test data, 140 pounds of coal were required to commercially melt 200 pounds of red brass. With coal at $3.00 per ton, the fuel cost is 21 cents. By actual test 7.4 gallons of oil are required to do this same work, and with oil at 4½ cents per gallon, the fuel cost is 33.3 cents. We found that two producers of 350 horse-power each would operate fourteen furnaces and produce 70 pots of metal per day of ten hours; therefore, on fourteen furnaces there would be a saving in fuel of 12.3 cents times 70, or $8.61 per day. Considering 300 working days per year, we could show a saving of $2,583 per year on fuel cost. A producer installation of two 350 units cost approximately $13,000, and the extra cost of preheater and gas furnaces over oil furnaces would be about $2,000, making an overall cost in excess of oil of $15,000. The labor to operate two producers will be two men at $2 a day, or $4 a day for 300 working days per year, or $1,200. The rest of the charges against the plant will be practically the same as for oil. A saving of $1,383 could, therefore, be shown on the overall plant per year. This represents 9 per cent. interest on the money invested.

The Furnace Output.

Now, it was found by taking the time of each individual heat during the test, that deducting the time for the first heat in the morning and its corresponding quantity of coal, the remaining heats required 100 pounds of coal per heat. The average time required per heat was one hour and thirty minutes. At this rate a furnace would be able to produce sixteen heats per day of 24 hours, and fourteen furnaces would produce 224 heats per day. With the oil furnace, the same number of heats could be obtained with a consumption of 6.5 gallons per heat. The comparison is as follows:—Two hundred and twenty-four heats at 100 pounds coal per heat gives 22,400 pounds, or 11.2 tons of coal, which at $3 per ton amounts to $33.60 per day. Two hundred and twenty-four heats at 6.5 gallons of oil per heat gives 1,456 gallons, which at 4½ cents per gallon amounts to $65.52 per day. The net saving in fuel cost per day for continuous operation will, therefore, be the difference between $65.52 and $33.60, or $31.92, and the saving per annum will be $11,401.20.

In conclusion, you will see that the gas producer melting problem for ten hour operation is approximately at a balance with oil at 4½ cents. Coal is a stable fuel as regards price, while oil is very unstable. The choice must be made by each user according to his best judgment. We cannot say definitely whether or not all brass melters should go to producer gas, but believe that each prospective installation should be carefully analyzed by competent engineers. From a paper read before the National Gas Engine Association.

Height and Area Features of Factory Buildings

Factory buildings of excessive heights or areas have long been recognized by underwriting organizations as a grave danger to life and property, owing to the difficulty of controlling fires in them. The evidence produced in this paper strongly supports the limitations advocated.

A PAPER entitled "Allowable Heights and Areas for Factory Buildings," was read recently by Ira H. Woolson, New York, before the American Society of Mechanical Engineers. The basis of the paper consisted of a summarised statement of replies received to inquiries pertaining to the subject sent out to five marshalls and five chiefs of towns and cities in the United States, of over 20,000 population. As the author aptly remarks, it is logical to assume that the men best fitted to determine safe limits of heights and areas are the men who have made a life work of combatting fires under all conditions of weather and hazard.

In the design of factory buildings ,one of the vital features tending to control the spread of fire is a judicious limitation of height and area. It is self-evident that whatever restricts a fire reduces the life hazard. Owing to the supreme importance of these two subjects, a person contemplating the erection of a building of this class should give careful consideration to the history of fires in such buildings, and the experience gained in fighting them. The question is more acute in this class of buildings than in any other because of the fire hazard which exists in them, and because of the economic advantages due to reduced costs in construction and supervision, when several large areas are housed under a single roof. Just where to draw the line so as to produce reasonable safety without prejudice to building investments is the problem.

Extracts From Fire Chief's Letters.

The following extracts from letters received from different fire chiefs may be of interest, therefore, as indicating their attitude of mind in relation to the questions asked:—

"In my opinion, from a fire-fighting standpoint, no building should be built over eight storeys."

"In our city there is room to grow on the ground without building high in the air. It is almost impossible for a public fire department to fight a fire from the outside above 75 ft."

"The figures given mean that every 66 ft. by 66 ft. should have a brick wall through length of building with Underwriters' doors; same to be double. As for width, in no case over 66 ft. wide; with solid wall, same to reach above roof at least 6 ft. Build on ground not in air."

"A building 8 or 10 storeys high, out in the open where it can be attacked from all sides should be handled very readily by a modern equipped fire deparment."

"I think that a factory should never be more than four storeys high. I almost feel that there is no such thing as fireproof construction from my own experience. I know that it is possible to store enough material in any building to burn it. I am very much in favor of dividing rooms in factories with fire-resisting walls, provided with automatic fire doors."

"While fireproof construction is the best, it is the contents placed therein that are the hazard to life and property. Buildings should not be constructed to a greater height than can be reached by fire department ladders; 85 ft. to upper windows.

"In my opinion no warehouse building ought to be over one storey in height. In regard to manufacturing buildings, I will say that I do not approve of any of these buildings being over three storeys in height. If they want room, let them build in length and not so high; that is just what makes such bad fires. These buildings have all kinds of combustible material in them, and they are sure to jump to another building, if they are four or five storeys in height."

"It is my opinion that all buildings for manufacturing and warehouses should be sprinklered, and not built higher than what the water supply will furnish and cover."

"Do not think any fire department can successfully fight a large fire over six storeys high, and ten storeys allowed only when there are two sources of water supply with good pressure."

"Area of sprinklered and unsprinklered buildings should be about the same, on account of increase in height allowed for fireproof buildings."

"All buildings of character named should be sprinklered."

"Joisted brick construction should not be allowed without sprinklers."

"I think a good sprinkler system is one of the best fire preventions that has been invented in a great many years, and if kept up properly, it is pretty hard for fires to get away."

"If I had my way, I would not allow any manufacturing plant to do business until it were properly sprinklered. It does things when they should be done."

"My experience with the 28 factories in this city has been that the sprinkler systems are out of order much of the time. Not looked after properly."

"This department has had no unfortunate experience with the sprinkler system, but, I do not feel inclined to depend upon them."

"The reason for not showing more favor to sprinklered risks, is because our experience with sprinkler systems in this city has shown them to be unsatisfactory, and not to be depended on."

"Stairs should be of steel without any wood sides; if any wood in the construction then there should be sprinklers. Should be sprinklers in all elevators even if they are enclosed, for an elevator is a bad air shaft. Brick factories cut up with wooden partitions are generally hard fires to fight."

"I do not approve of small rooms in factories, they make it very hard for a fireman to fight his way through smoke trying to find a fire when a building of this kind is partitioned off so much."

"In considering the limiting of height and area of a building, the question of accessibility should play an important part."

TOOL STEEL.

A GREAT increase in cost, of late years, says a writer in the Machine Tool Engineer, is shown in the tool steel bill. This can only partly be accounted for by the difference in price of the high-speed steels and the rise in price of water hardening steels. A large part of the extra cost is generally due to the toolsmith not knowing the various correct treatments of the steels. Plenty of treatment charts are forwarded by the steel-makers, but in many cases these never reach the toolsmith for whom they are intended. Even when they do, they are not always worked to, and the instructions rigidly followed out as they ought to be. Before printing these instruction charts, the steel-makers go to considerable trouble and expense in making tests to get the best results, the chart being compiled on actual results attained.

Buying Tool Steel.

The reason usually given by the toolsmith for not working to the chart is that there are too many to work to, meaning that there are too many different sorts of steel in use, each having their own set of rules for treatment. This occurs when two or three people give the orders. In some cases one of them is a purely commercial man, often influenced in his choice by the apparent cheapness of a brand offered. To get the best results, the buying should be invested in one man, who should be capable of choosing the steel best suited for the work, and the efficiency of the machines.

Classes of Steel.

It is not economical even in the most up-to-date shops to use only one make of steel for all the different machine tools. It will be found possible to use a cheaper steel on the light lathes and machines, than on the larger types, and still get the full output. The machines should be divided into two or three classes, three at most, and a steel chosen for each class which will take the heaviest cuts the machines will stand. The toolsmith will only have three different treatments to learn, and will soon be able to get the exact degree of hardness for each; with the result that the tools will last longer, the machine men will work more comfortably, time will be gained by not having to take the tools so often to the stores to be changed, and repairs by the toolsmith and his striker will be less.

Exception to Classification.

A hard and fast rule should not be made that a higher-priced steel must not be used out of its respective class, the rule being intended only for the ordinary tools most often used and in large numbers. It is sometimes more economical to use the high-priced steel even for the small machines, as when a particular form of tool is required, which entails considerable labor in shaping, and a large number of articles have to be machined by it. Although the initial cost of the tool is high, it comes out small when spread over the large number of articles manufactured by its use. Its lasting qualities enable it to be used a longer time before being re-ground, and it retains its correct shape, enabling the operator to cut nearer to limit sizes. The water hardening steel will never be entirely superseded by the air hardened, especially in hand tools, such as chisels, etc.

Charles Warnock has been appointed sales manager for the Algoma Steel Corporation, Ltd., Montreal, Que., which will hereafter do its own selling instead of dealing through agencies. Mr. Warnock will have headquarters in the McGill Building, McGill Street.

The Reversing Electric Motor Drive for Planers, Etc.

The idea of applying reversing motors direct-connected for driving planers has been practiced for some 8 or 10 years, yet their application has been more or less of an experiment until about a year or so ago. The accompanying article dealing with the subject is taken from the Railway and Engineering Review.

THE use of the reversing electric motor drive, even in the first stages of its development, emphasized strongly that it possessed many advantages over older methods of reversing through clutches or belt shifters. Not only is the usual economy effected in the consumption of power through application of the principle of direct-connected individual operation, but maximum cutting speeds are sustained uniformly, acceleration is more rapid on the return travel, and a rate of production, hitherto unattainable, results. The reversing motor drive has ushered in new records in machinery castings.

Naturally, the effective performance of this drive has created a demand that has warranted exhaustive study and tests by manufacturers in developing it for commercial purposes. However, perfecting the reversing motor drive for reliable and successful operation has required time, and it, therefore, can be said to be of comparatively late origin. The General Electric Company has recently placed on the market a reversing adjustable speed direct connected motor drive that has been carefully tested and tried out in service.

Application Unlimited.

Probably the most interesting application of this drive to machine tools at the present time is to planers, viewed both in the light of an engineering achievement and from the standpoint of production. That a very large increase in output does obtain with planers through this means is now firmly established, and quite generally understood. The application of the reversing motor equipment in its various forms is almost unlimited. It is now used not only to drive planers, but also screw, worm and rack-driven slotters, turret lathes, wire and tube-drawing machinery, and other classes of machines reversed through clutches or shifting belts, which methods are often low in efficiency and high in maintenance. A desirable feature of the G.E. reversing motor drive is that it may be attached readily, wherever electric power is available, to machines already installed and in use, as well as to new machinery.

General Electric Co. Motor.

The motors for this service are mounted in any place on the machine or floor convenient for mechanical connection. They are of the standard General Electric commutating pole type with a speed range of 250-1,000 r.p.m. at 230 volts., up to and including 100 h.p. planer rating. These combinations of speed allow the motor in the majority of cases to be coupled direct to the driving shaft of the machine.

The Control.

The control consists of a contactor panel and master switch. The contactor panel is usually mounted on the side of the planer housing, or in any convenient place on other machine tools to which the drive may be applied. The panel is made up of eight contactors, similar in appearance to a series contactor, but actuated by shunt, series or differential coils in such a manner as to eliminate entirely electrical disc interlocks. An additional precaution is taken by using mechanical interlocks to prevent the possibility of short circuits. The panel, field rheostats and all accessories are enclosed in a cast-iron box, the cover of which is hinged, so that when swung open the contactors are easily accessible.

The box itself is pivoted about liberal openings in order that the rear of the panel may be swung into view for inspection when required. The leads are carried through these same openings, from either top or bottom, which prevents them from chafing when the panel is swung out. The field rheostat handles are brought out through the cover of the enclosing case and are plainly marked "cut" and "return." The pointers of these handles traverse a blank ring, which can be marked or graduated for cutting and return speeds in feet per minute.

The Master Switch.

The master switch is generally mounted on the side of the planer bed, or in other convenient place. The switch is simplicity itself, containing only contact figures, two forward and two reverse, one being used in common for both directions, and three segments on the drum, all of liberal proportions. Its sole function is to close the shunt coil circuits of the forward and return line contactors. The motor field is entirely external to the master switch. The panel is encased in a stout cast-iron box, so arranged that the parts and the wiring are most accessible. The master switch is operated by dogs on the planer table in much the same way as is now employed for shifting belts. A special double-pole C. P. circuit breaker is also supplied, which provides for minimum voltage and overload protection. In case the breaker opens or current fails through any cause, it automatically stops the motor, preventing the platen from coasting off the ways.

Starting, Stopping, Reversing.

By virtue of the commutating pole design of the motor, starting, stopping and reversing are accomplished with sparkless commutation. In order not to brake dynamically from high speed in one violent step, means have been taken to accomplish this in three distinct steps, braking down slowly from high speeds, and then quickening the brake action at lower speeds. This could not be accomplished with one step of resistance, for, at the lower speeds, the braking action becomes almost nil, dragging out the processes unnecessarily. Thus, the entire braking is completed in the shortest possible time without undue shock. This feature, in addition to quickening the brake, will be recognized as a decided advantage in the maintenance of the machine. Reversing is effected without the delay incidental to the use of sluggish relays. A noteworthy point in connection with the operation of this drive is that the planer reverses extremely close to a line at the end of the cut.

After voltage failures with the master controller in the running position, the motor will start up in the regular way, upon return of the voltage to the line without complications by closing the breaker. This operating characteristic is very desirable. Cutting and return speeds are entirely independent of each other, so that it is possible to use the slowest cutting speed and the highest return speed, or vice versa, in any combination not exceeding four to one, with thirty-five to seventy cutting speeds and the same number of return speeds, depending on the size of the equipment.

Existing Machine Attachment.

In the event of attaching the reversing motor to machines already in use, the speed of the driving shaft on the majority of planers will be low enough with the slowest cut to meet the motor speed of 250 r.p.m., and only a coupling and the necessary motor foundation will be needed. If, however, the planer gearing is of such a ratio that the speed of the driving shaft, when making the slowest cut required, is lower than the motor speed, 250 r.p.m., an intermediate gear and pinion have to be installed for the reduction. In the latter case, an outboard bearing should be provided, which can be taken care of either by motor shaft extension, or, if the standard motor shaft be used, by a special pinion with shaft extension for outboard bearing. Where the motor is coupled direct to a planer shaft driving through bevel or worm gearing, provision should be made for taking care of the thrust.

Suitable planer dogs are furnished in each instance, and should there be a boss or web directly behind the position of the operating lever, the bracket supporting the lever can be extended and mounted on a strap suitably bent for the purpose. The complete equipment comprises the circuit breaker, motor, contactor control with pendant switch, if desired, master switch, two dogs, main operating lever, auxiliary operating lever and bearings for the auxiliary shaft. On account of variance in location, bends and length in individual machines, the auxiliary shaft and the connecting rods from this shaft to the operating lever and master switch are not included.

Operating Features Summary.

Briefly summarized, the salient operating features claimed by the manufacturer for the reversing adjustable speed direct connected motor drive are: Maximum cutting speed sustained uniformly, affording greatly increased production; rapid acceleration on the return stoke; reverses remarkably close to a line at the end of the cut; very economical operation and upkeep; any speed desired within a ratio of four to one; many speed combinations, allowing the slowest cutting and highest return speed to be combined; freedom from shocks, permitting the quickest reversals possible without jar; quiet operation; sparkless commutation, and positive and safe control within easy reach of the operator.

✲

METAL POLISH TABLETS.

SOAP, cut fine 16 parts; precipitated chalk, 2 parts; jeweler's rouge, 1 part; cream of tartar, 1 part; magnesium carbonate, 1 part; water enough. Dissolve the soap in the smadllest quantity of water, over a water bath. Add the other ingredients to the solution while still hot, stirring all the time to make sure of complete homogeneity. Pour the mass into a box with shallow sides, and afterwards cut into cubes.

Recent Judicial Decisions

Edmonton, Alta.—Ten thousand dollar's damage is claimed by Daniel Russ for injury to one of his eyes while, it is alleged, he was working for Pheasy and Batson, last November. During that month the complainant claims a belt in the factory struck him in the eye and caused it to be bruised, causing trouble.

Montreal, Que.—The law suit over the use of the word "Denis" in connection with the advertising of a sign business carried on by two distinct firms in the city has been settled, amicably. The Denis Advertising Sign Co. took action to force J. A. E. Denis to eliminate "Denis" from his advertisements, claiming that it was an infringement of the rights as granted them through their Act of Incorporation, and that they suffered great inconvenience through the action of Mr. Denis. The latter finally agreed to revert to his old firm name of the "Eagle Sign Company," and Judge Lane disposed of the case accordingly.

London, Ont.—The John McNee & Sons Cigar Co., of London and Windsor, is restrained, by an order issued by Judge Murphy on June 14, from interfering further with the business of the Memmeter Cigar Factory, of Detroit, by taking away its employees. The Detroit company brought suit at Windsor, alleging that Frank Boult, former foreman for the Detroit firm, had been persuaded to help the Canadian manufacturers establish a new factory in Windsor. It was alleged that he had taken with him valuable trade secrets and that he had enticed away valued employees from the Detroit firm. This was denied by the Canadian firm, although it was admitted that many Detroit cigarmakers had left the Hemmeter Co. to cross the river.

Toronto, Ont.—Claiming heavy damages on account of the alleged failure of a motor-driven grain chopper purchased at the Canadian National Exhibition last year, Alf. Livingstone, of Thistletown, is suing the International Harvester Co. before Chief Justice R. M. Meredith in the Non-jury Assize Court at the City Hall. On the witness stand, the plaintiff stated that he had purchased the machine upon the assurance that it would crush a certain amount of grain on the consumption of a given quantity of gasoline. This, he said, it had failed to do, with the result that he lost considerable business. Mr. H. M. Mowat, K.C., counsel for the Harvester Co., advanced the rather novel argument that the gasoline sold in Canada was of a much lower grade than that sold in the States, with the result that a great deal more of the Canadian variety was required in order to develop the same power. As the chopper was made in Milwaukee the guarantee was based upon tests made with American gasoline. He also argued that the plaintiff was incompetent as an operator, having had no experience with gasoline motors prior to his purchase of the grain chopper. No fault was found with the engine itself and a sample of the grain chopped by it was admitted to be excellent. His Lordship finally suggested that an expert be retained to present a report as to whether the engine could perform the amount of work claimed and the case was adjourned until this evidence is obtained.

✲

BUILDING ON HABIT.

THE natural and most efficient scheme of conducting business is to build on habit. The specialist is superior to the Jack-of-all-trades. This fact has been known for centuries, but never before have conditions existed which have so forcefully demonstrated it. It applies to the business and commercial side of the industries as much as it does to the manufacturing side.

The skill of the workman is due to his continual application to his own particular work. A lathe hand cannot turn out his best day's work without his own lathe and his own tools, his own bench and work and general surroundings. Give him another lathe of even the same "make," and it may be days before he attains his previous record. Change his work frequently, and you have reduced his output. This condition

There is a misuse of energy when specialization is not practised, and in such dissipation of energies there has been wasted something that is of greatest value. The individual has had the pleasure of working very hard, but at the end of the week or year or life, it is clearly apparent that the plan of work has been faulty. It has gone contrary

We do a great wrong to men when we direct or restrict them to performing their work inefficiently. Congenial labor is, we know, one of the greatest blessings in the world. It is a greater blessing to the worker than to any one else, but it should be rightly directed by those in positions to direct. If it is allowed to be expended in effort that goes contrary to all natural laws, there is a great loss to the world, to the industry and to the man. The drone is of more use to the world than the man who misdirects labor.—James Hartness in the Transactions of the Efficiency Society, Inc.

Place and Necessary Qualification of the Salesman*

By W. T. Todd**

In this progressive age, the race for commercial supremacy or business leadership is one in which the commercial salesman or representative of the house plays a very important part. Unless he measures up to the high standard required, and has the necessary qualifications, he cannot expect to reach the goal, as, in the end, it is usually a case of the survival of the fittest.

IN my 30 odd years' experience in the supply line, I can truthfully say that the prizes in business to-day go to the men who keep profitably busy as a result of their own initiative. There are too many men who do passably well what they are told to do, and when they have finished the task, inquire helplessly — "what next?"

Initiative Feature.

Don't be a train car, always following —depending ever on the man ahead for your ideas and motive power. Be your own accelerator. Get up your own speed. Look for tasks ahead. Keep records of things to be accomplished—remembering that the world is full of people who are "waiting for something to turn up." Believe in yourself; in the goods you sell; in the house you represent; in the hands that create; in the brains that think; and that when you have made a sale, you have also made a friend. Believe in cheerfulness. Get rid of the frown. Don't worry. If anyone has to have a grouch, let it be your competitor—you do the smiling. It is easier to find successful men than failures, because those who succeed are in evidence, while those who fail pass into oblivion.

Impress Your Customer.

Did it ever dawn on you that the organization you represent, as well as the various manufacturers, whose merchandise they handle, manufacture a class of goods that are absolutely essential to the men upon whom you call, and that, with such a wide line from which to choose, the successful salesman should be able to select some particular article that would appeal to his customer and enable him to leave a lasting impression behind, as well as securing orders.

In starting on each trip, why not select some article of merit and frame up an interesting talk, and spring it on your customer? Then, in calling on your man, instead of the usual "Just dropped in to see if there was anything wanted this morning," and the reply, "Can't think of anything to-day"—spring your story; get him interested for five minutes, instead of five seconds, and perhaps walk away with an order or with at least having left a pleasant impression behind and something for him to ponder over. This method faithfully followed up will soon show results and command the respect of the buyers. You will find some of them asking you for advice regarding the selection of certain goods, when they realize fully that you know something about the article which you are selling and that you are not simply an "order-taker."

Seeing the Practical Man.

Sometimes it is necessary to see the man behind—the practical man who keeps in touch with new developments. Usually this is not an easy task. He may be located in an obscure place, and cannot be reached through the office, and you may have to wait for him on the street or perhaps at his home; but on the whole he is much easier to approach and get acquainted with than the man in the front office. When you have met him, and explained the merits of your article—what a different aspect it will place on the selling to the man in the front office. Before, you found yourself permitted to submit prices (which in turn were picked to pieces by the buyer, to meet some other competitive figure, which, in some cases was an imaginary one); now you have an opportunity to talk quality, and show the practical man wherein your article is superior and better suited to his particular requirements, regardless of price; and when the "order-placer" tries to drive you down you can simply smile and stick to your price, usually with satisfactory results.

Service Feature.

The basis on which goods are sold today is "service." The price at which the goods may be sold depends upon the service the goods will be to the buyer. The value of the salesman in dollars and cents depends upon the service which he is able to render both the customer and the house he represents.

Truth and Honor.

Any business, to grow and be successful, must treat its customers fairly and honestly. A cute trick may give slight temporary advantages, but the foundation of the house must be laid with strict integrity and honesty of purpose, if customers are to be retained and repeat orders expected and their numbers multiplied as the years roll by. When a salesman recommends a certain article for a certain class of work, he should do so with strict integrity; and the goods must be right for the purpose intended and must be honestly sold, thereby making the transaction mutually beneficial to both parties. Under these conditions, the customer soon forgets that he paid a good price for the article, but will never forget the salesman or the house he represents, that made good; and when in the market again, he will then have an opportunity to serve him and also recommend him to his friends. This requires, in all cases, not only the hearty co-operation of the salesman with the organization he represents but also the very best individual efforts of each one having any part in the transaction.

To give your customer the best you know for the smallest safe price, is the best general proposition to-day.

Individuality.

The successful salesman must assert his individuality; if he does this he will gain confidence in himself day by day and will be able to talk a thousand-dollar proposition as forcibly and well as the most trivial article he has to sell. When a man's personal appearance deteriorates, he becomes timid, loses steam and can't "talk up" his goods or service with enthusiasm; he becomes self-conscious and belittles himself in his own mind and, therefore fails to make good. In short, "clothes do not make the man" but neat, up-to-date and proper clothing gives him the proper self-confidence so essential to a progressive salesman.

Everything, no matter what, depends on the Man. The one thing in the universe that refuses to stay in its pigeonhole is a human being. After all, the only thing about a man for which the world care sin his Individuality. Your accomplishments and possessions do not matter much. It is the "Pearl of great price," the one treasure he has which no one else has. In art, it makes one's work great; in letters, it makes one's writing worth reading; in business, it is the touchstone of success; in society, it is the secret of popularity; in love, it is the very core and substance, and in religion it is the keynote. All true education is to develop this; all true culture is to perfect it; all true religion is to keep it unspoiled. "What shall it profit a man if he gain the whole world and lose—Individuality."

Confidence.

One of the greatest advantages to a salesman is Confidence. In fact, business is built on confidence. Give Confidence, and you will win Confidence; and your material reward is certain. Before a sale can be consummated, the buyer must trust the seller. Having, now, secured confidence, it can only be retained by the pursuance of square dealing; the keeping of promises; in fact, "delivering the goods."

---

*From an address given before the Society of Steam Supplies Salesmen, at Pittsburg, recently.

**Secretary, the Somers, Fitler & Tod Co., Pittsburg.

The salesman who makes no effort to win Confidence makes few sales and lacks that faculty which enables him to meet the buyer on common ground. Too many salesmen see only the immediate sale. Too many forget that the customer must be looked to in the future for repeat orders, and make promises that their house cannot fulfill. The successful salesman looks further ahead. He sees the sale that will be made to the satisfied customer's friend on his recommendation; and that future business will result from satisfying and commanding the confidence of everyone dealt with.

Without Confidence, this world would be in a turmoil; great enterprises would not be started; credit would vanish; therefore, Mr. Salesman, seek to win Confidence.

Good Will.

Good Will is a most valuable business asset. It is indispensable to healthy growth and success. How to increase it or build it up should be a subject that the successful man should never lose sight of. No business ever suffered from an oversupply of it. Courtesy, attention, sincerity of purpose, honest methods, good values, and being able to supply what the trade needs and wants, all play their part in building up this incalculable asset, Good Will.

Business success or failure are both due to definite cause; not to luck, as some people imagine. The salesman who hopes for a stroke of luck to raise him above his fellowman is usually disappointed; and one of the biggest causes of success is sincerity of purpose, which consists of high ideals and an ambition to render the highest grade of service apart from the financial returns. Nothing great was ever accomplished by the sole incentive of financial reward. Every man who has accomplished something or been successful, will tell you that he never lost sight of the fact that he was working toward a certain point—a goal.

Offer to your customer the advantage of dealing with a house which will maintain at all times a high standard of quality in the goods it sells. Offer him prompt and efficient service. Show him that he will at all times be treated with uniform courtesy, honesty and fairness. Display a pleasing and enthusiastic personality as well as an accommodating disposition, coupled with an ability and a readiness to serve on the part of your house and make it clear that your prices are uniformly right, and as low as is consistent with good quality and efficient service.

Ability Feature.

The salesman of to-day should possess large abilities and should be familiar, not only with his own line of goods, but also sufficient of his competitors' line to enable him to handle conditions when they arise. A salesman may have a first class article to sell at a given price, which is a fair price, while his competitor may have an inferior or substitute article somewhat similar, on which he is able to quote a lower figure; and if the salesman is not familiar with his goods and those of his competitor, he is inclined to meet his competitors' figures, throwing away good, legitimate profit to which his house is entitled and lowering his own ability as a salesman.

Study, therefore, the line you are selling and so demonstrate to the buyer the quality and service you have to offer as to put the question of price secondary.

Knowledge of Your Business.

The successful salesman must have a thorough knowledge of his business; be a man of stability, strong character and backbone, energy, enthusiasm, good health and morals, honest and sober. Those who lack confidence in their ability to sell at an equal or better price than their competitors, seek the line of least resistance, viz., a concession in price to effect their sales, which finally leads to their elimination from the selling ranks. A courteous declination to meet a cut price will often enhance the buyer's respect for the salesman and the house he represents. While, on the other hand, a too ready compliance with demands for lower figures will neither command respect nor the confidence of the trade in general.

One of the ruling powers in any business organization is public opinion of the character or reputation of the company for honesty and fair dealing; and this public opinion is determined by the salesman and by every individual who helps to make up that organization.

Reputation Building.

The salesman sometimes forgets the fact that in the daily discharge of his duties he not only represents himself, but that in the eyes of the people with whom he comes in contact, he is reflecting the attitude of his entire organization and building a reputation for both according to his actions. Having the future welfare and advancement of his company in mind, he should establish a reputation for honesty and square dealing that will prove a most valuable asset —one of incalculable value, that will compound as the years roll by, and is bound to bring successful results, both to himself and the company he represents.

ELECTRIC LOCOMOTIVES.

NINE electric locomotives of 1,400 horse-power normal rating, and capable of being overloaded up to 5,000 horse-power, have been ordered by the New York Central Railroad Co. They are claimed to be the most powerful locomotives yet constructed. The tractive effort will enable a 1,000-ton train to attain 60 miles per hour. The type of construction adopted is that of having a motorman's compartment at either end with contractor gear, resistances, brake compressors, etc., housed midway in a central compartment. The coach is supported upon the centre pins of the two portions of an articulated frame, each portion running on two fixed axle trucks. The motors, which are eight in number, one to each axle, have a continuous rating of 260 amperes at 600 volts under forced ventilation, and 325 amperes for periods of one hour; the current being collected by eight underrunning third-rail shoes.

Two pantagraph type overhead trolleys are also fitted for use on sections where the third rail is not installed, these being operated from the motorman's compartment by foot lever control pneumatic gear. The forced ventilation for the motors is obtained from compressors, the air being driven through the box form type of girder and down through the hollow centre pins on which the coach is supported. The weight of the cars is 100 tons, and the entire length of frame 22 ft.

GREAT LAKES WATERWAY.

IF plans which Mayor Clay, of Windsor, Ont., proposes to submit to the Convention of the Union of Canadian Municipalities of Saskatoon, on July 17, are carried to a successful conclusion, Windsor, Detroit and other cities on the Great Lakes may become ocean ports.

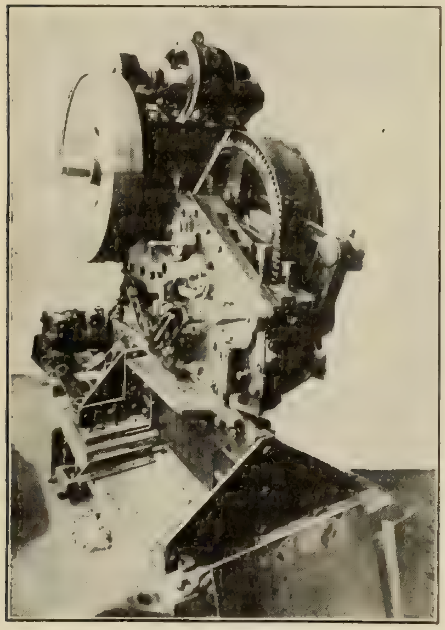
He intends to submit a proposal to present a memorial to the Dominion Government urging the deepening of the Welland, Rideau and other canals to perfect a waterway from Lake Superior to the sea. This would make possible the navigation of ocean vessels to the extreme end of the great lakes and settle a problem now prominently before the Dominion.

The mayor believes the United States would contribute toward the financing of this scheme, as American ports along the lakes would benefit as much as those on the Canadian side. The Great Lakes Waterway Route has all the advantages of the Georgian Bay Canal, and besides would tend to build up existing lake ports. If the plan he will submit be adopted, the industries of Canada would be built up through increased facilities for foreign trading. Foreign shippers would also benefit.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

TRIPLE COMBINED PUNCH, PLATE SHEAR AND BAR CUTTER.



TRIPLE COMBINED PUNCH, PLATE SHEAR AND BAR CUTTER.

An example of centralization of manufacturing processes in one machine is the triple combined punch, plate shear and bar cutter, built by Henry Pels & Co., 90 West Street, New York City. The splitting shear will split plates up to ½ inch, any length or width, or bars up to ⅝ inch. The bar and angle cutter, shown in the centre of the machine, will cut rounds and squares up to 1½ inches; angles and tees, 3 by 3 by ½inch; and angles on a bevel of 45 degrees, up to 2 by 2 by ¼ inch. The bevelling of angles is accomplished without any change or adjustment of the knives for either right or left hand bevelling. With interchangeable knives, beams or channels up to 5 inches can be cut on this end. The punching end is built with any depth of throat from 12 inches up to 30 inches on standard machines. The machine will punch ⅞ inch holes through ½ inch material, or equivalents. The punching end is equipped with a removable block for architectural jaw, to punch in flanges of structural shapes.

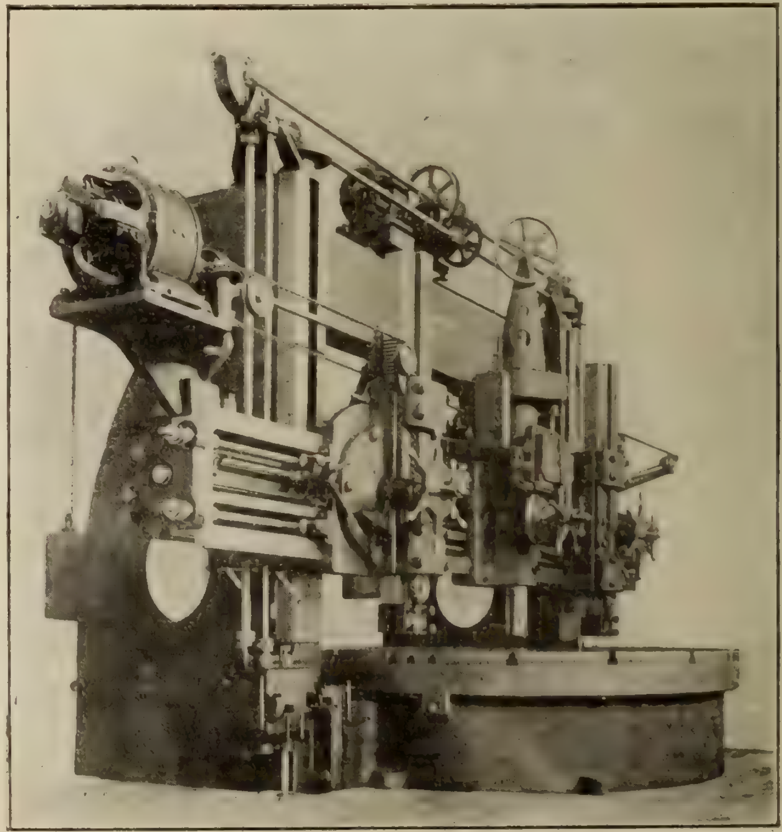
All three tools of the machine make 25 strokes a minute; the 3½ h.p. direct-connected Westinghouse motor, with which it is equipped, being capable of driving all three tools simultaneously at their maximum capacities. The net weight of the machine, including the motor, is 3,250 pounds. The frame is constructed of a single plate of forged steel of high tensile strength. This construction is considered to be the strongest and most up-to-date known. All slides and plungers are of forged steel, and all bearings are phosphor-bronze bushed. The flywheel shaft has an adjustable ring oiler bearing, and the power is transmitted by means of a semi-steel gear crown bolted to the flywheel through a rawhide pinion on the motor shaft.

* * *

RAPID POWER TRAVEL BORING MILL.

Rapid power travel in heavy boring and turning mills is always an important factor. This has been accomplished by the application of a separate motor drive 10 on the 10 ft. machine manufactured by the Betts Machine Co., Wilmington, Del. This machine swings 10 feet 4 inches in diameter, and takes in work 62 inches under the toolholders. It is provided with power rapid travel and all-gear feed to heads, giving absolute control. The workman, without moving from the head, can operate his quick power travel to head and spindle in either direction. He can change from power travel to feed, and vice versa. The feeds can be operated in either direction, and the tools set to size the work. The machine is equipped with a motor-driven central boring head, which has a revolving spindle with independent drive and feed mechanism. Limited lateral movement is provided for the purpose of doing other than central boring.

The mill is driven by three Westinghouse motors—one of 20 h.p., 400-1,200 r.p.m., for the main drive; one of 5 h.p., 400-1,600 r.p.m., for the central boring head; and one of 5 h.p., 1,130 r.p.m., for the cross rail elevation and power travel. The total weight of the machine, including motors, is 80,000 pounds.



RAPID POWER TRAVEL BORING MILL.

MACHINERY EXHIBIT AT ATLANTIC CITY.

Concurrent with the recent conventions of the American Railway Master Mechanics' and Master Car Builders' Associations at Atlantic City, N.J., the Railway Supply Manufacturers' Association held its annual exhibition of machine tools, railroad appliances and accessories. The space occupied amounted to 88,200 sq. ft., being an increase of some 4,700 sq. ft. over last year.

The Million Dollar Pier housed all the exhibits, with the exception of a few under canvas, and on convenient railroad tracks and the registered attendance at both conventions was in the neighborhood of 5,000. Much interest was taken by those attending the conventions and by the general public, in the exhibition, particularly with reference to equipment in operations. The following officers were elected for the ensuing year by the Railway Supply Manufacturers' Association:

President, Benjamin A. Heganman, Jr., U. S. Metal & Mfg. Co.; vice-president, J. Will Johnson, Pyle National Electric Headlight Co. Members of the executive committee, C. B. Yardley, Jr., J. C. Currie, C. F. Elliott and Joseph H. Kuhns.

* * *

C.P.R. 1913 IMPROVEMENTS EXPENDITURE.

ONE hundred million dollars will be spent on improvements to the Canadian Pacific Railway System this year, according to an official statement made by Sir Thomas Shaughnessy on June 27. This will mark a record in expenditure for the C.P.R. Sir Thomas' statement in part is as follows:--

The company's appropriations for the construction of additional railway mileage, for cars and locomotives, terminal facilities at St. John, Montreal, Toronto, Fort William, Winnipeg, Calgary, Vancouver and elsewhere; for ocean steamships and hotels, extensions of the telegraph system, shops, sidings and improvements generally in Canada, will approximate no less a sum than $100,000,000.

* * *

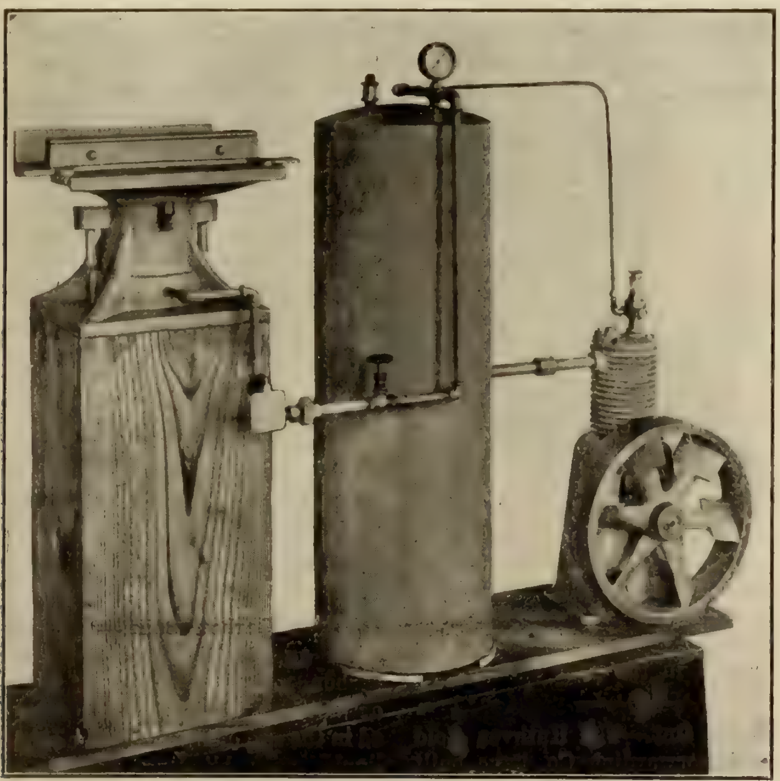
JARRING MACHINE UNIT.

THE Federal Core-Jarring Machine is designed for bench core making, and the illustration shows a unit which has been made up specially for foundries not equipped with a compressed air service.

The outfit consists of a No. 1 core-jarring machine having a table 12 ins. x 12 ins., a 3-inch cylinder of a working capacity of 300 lbs., a 3 in. x 3½-in. air compressor, receiver and governor. To ensure the success of this unit great care has been taken in designing a suitable compressor; one special feature being the suction valve, which is of the disc type, the disc being made of vanadium steel. The valve is raised off its seat just as soon as the piston starts on its downward stroke, allowing the air to rush into the cylinder, consequently no power is used during that stroke. The compressor is of sufficient capacity to operate five machines.

The jarring machine is made in two sizes, the tables being 12 x 12 ins. and 18 x 18 ins. respectively. It should be set up preferably on a wood block, and not attached to the bench, as it is undesirable to communicate vibration to the latter. The table is fitted with a flange at the back, which acts as a stop for the core box. There is also an adjustable clamp which slides on from the front until its ratchets engage with the side notches nearest the core box. Two strong springs take up the slack. This makes a very quick and secure method of holding the core box in position. The operator controls the air for working the machines by means of a knee lever, leaving both hands free to fill the box. Several core boxes of irregular shapes can be worked on this machine at the same time.

The unit is manufactured by the Federal Foundry Supply Co., Cleveland, Ohio.



FEDERAL "COMPLETE JARRING MACHINE UNIT."

BOVING & CO. OF CANADA, LTD.

THE business of the Canadian Boving Co. is now being operated under the title of Boving & Co., of Canada, Ltd., in order to bring it into line with that of the other branches of Boving & Co., Ltd., London, England, which are operating in Japan, New Zealand, Brazil, Mexico, etc. Owing also to the great increase in the volume of business, and to their having purchased the works of the Madison-Williams Manufacturing Co., of Lindsay, Ont., the capital of the company has been increased to $1,000,000, a portion of the first issue having been found in Canada. They are now in a position to turn out in their Canadian works the following machinery:—Water turbines, centrifugal pumps, pulp and paper making machinery, sawmill machinery. Of the above, the centrifugal pumps have been hitherto made in England; the water turbines, pulp making and paper making machinery in Sweden; while the sawmill machinery has been manufactured by the Madison-Williams Co. in Lindsay.

The Canadian Boving Co. completed their first large plant in Canada in 1910, viz., water turbines of some 8,000 H.P. for the Calgary Power Co., and other important contracts which have since been executed are:—

City of Winnipeg—5 double horizontal open flume Francis turbines of 25,000 h.p.; and 2 double horizontal enclosed Francis turbines (exciters) of 900 h.p.

The Sydney Power Co., Trenton, Ont.—4 double vertical open flume Francis turbines of 6,000 h.p., and 4 double vertical open flume Francis turbines of 4,800 h.p.

Chicoutimi Pulp Co., Chicoutimi, Que.—2 double horizontal enclosed Francis turbines of 8,000 h.p.

Town of Farnham, Que.—2 double horizontal open flume Francis turbines of 1,130 h.p.

Town of Welland, Ont.—1 turbine of 250 h.p.

St. Francis Hydraulic Co., D'Israeli, Que.—1 double horizontal enclosed Francis turbine of 1,600 h.p.

Carillon Construction & Development Co.—1 turbine of 300 h.p.

City of Penticton—2 turbines of 380 h.p.

Ocean Falls Pulp Co.—6 single horizontal enclosed Francis turbines of 10,800 h.p.

Centrifugal Pumps.

Centrifugal pumps with capacities ranging from 220,000 to 54,000,000 gallons per 24 hours, and operating against heads of from 44 to 440 feet, have been supplied to and installed for the following municipalities, mining, and manufacturing concerns:—

City of Toronto, Nipissing Mining Co., Montreal Water & Power Co., City of Welland, Ont.; Delta Municipality, City of Moose Jaw, E. B. Eddy Co., Hull, Que.; City of Prince Albert, Town of Preston, Ont., etc. A considerable quantity of pulp making machinery has also been installed.

The experience gained during the past three years by the Canadian Boving Co. has enabled them to gauge the Canadian market, to familiarize themselves with what is actually required by and most suitable for that market, and by reason of their having let out contracts for various details of plants to Canadian firms they have been able to form an accurate idea of the cost of manufacturing such plants in the Dominion.

The Canadian company is working in close alliance with Boving & Co., Ltd., Union Court, Old Broad Street, London, England, to whose designs their machinery will be manufactured with such modifications as may be necessary to suit Canadian requirements.

Boving & Co. of London, England, have carried out some very large hydroelectric contracts, including work for:—

The British Aluminum Co., Ltd., London.

The Waihi Gold Mining Co., New Zealand.

Mt. Lyell Mining & Railway Co., Tasmania and London.

Hydro-Electric Power & Metallurgical Co., Tasmania.

Kinguawa Hydro-Electric Co., Japan.

The City of Kyoto, Japan.

The Sagami Hydro-Electric Power Co., Japan.

The Governments of Western Australia, New Zealand, Egypt, Soudan, India and others, and the London County Council, while they are also on the Admiralty and the India Office list for the supply of hydraulic machinery.

The existing works are quite up to date, having been built in 1906. Large additions, however, will be made to them immediately, so that, in twelve months' time, the capacity will be about four times that of the present shops, and a number of new and up-to-date machine tools will be added so as to ensure the most accurate workmanship, as now required for modern machinery. Furthermore, they will be in a position to give prompt deliveries, and possibly improve on their prices, whilst maintaining the same high standard of efficiency and design which has always been their aim.

U.S. IRON ORE PRODUCTION IN 1912.

THE iron ore mined in the United States during 1912 amounted to 55,150,147 gross tons, compared with 43,876,552 tons mined in 1911, an increase of 11,273,595 tons, or 25.69 per cent., according to an advance statement by Ernest F. Burchard, of the United States Geological Survey. The production of 1912 was second only to the output of 1910, falling 1,864,759 tons below the record production of that year, which was 57,014,906 tons.

Ore Marketed.

The total quantity of ore marketed in 1912, according to reports received, was 57,017,614 tons, valued at $107,050,153, compared with 41,092,447 tons, valued at $86,716,575, in 1911. The average price per ton in 1912, according to these figures, was $1.88, compared with $2.11, in 1911. This represents the selling value of the ore f.o.b. at the mines, but does not include any freight costs. The extreme range in values in 1912 was between $1.01 a ton for red hematite, and $3.70 for brown ore. The average price for red hematite in 1912 was $1.87; brown ore averaged $1.79, magnetite $2.18, and carbonate ore $1.96.

According to the reports of producers, many of which have been somewhat revised since the report for 1911 was published, the total quantity of iron ore in stock at the mines at the close of 1912 amounted to 10,241,287 tons, compared with 12,206,390 tons at the close of 1911, a reduction of 1,965,103 gross tons, or 16.1 per cent., which balances closely with the excess of sales over quantity mined.

* * *

The Foundry & Machine Exhibition Co., C. E. Hoyt, secretary, has issued from the secretary's office at Chicago its 1913 prospectus. It is a well printed pamphlet of 96 pages 6⅛ x 9¼ in., announcing the exhibition which is to be held at the International Amphitheater, Chicago, October 10-17. A plan is shown of the exhibition floor containing 75,000 sq. ft. of exhibit space, and there are general views of the exhibits at Buffalo and Pittsburgh in the past two years.

* * *

Leamington, Ont.—The Ruthven Cold Storage and Forwarding Co. have built a large plant here, and will start operations shortly.

VALUE OF EFFICIENT ADVERTISING.

WE cannot say much more than we have already said along efficiency lines, but we can point to the fact that advertising changes the habits of the nation. We know it is not much understood, and it has been indicated here and elsewhere in the public prints that its importance is not appreciated. In a Senate report on the 'High Cost of Living,' eager to avoid the tariff and other things, they seized upon advertising as a scapegoat, to explain the increasing cost of living.

In the annual report of the leather company, we find that recently their affairs have not been prosperous and conditions were not good. They do not advertise; but referring to the packing companies, as large and as uncertain, and as dependent upon general conditions as the leather company, we find that owing to their advertised by-products, their profits have been conserved and they are paying a dividend.

By advertising we have made a clean nation. The soap publicity has changed the habits of the country. The constant picturing of the bath-tub has changed the nation in that respect, because we have trained the public ideal in the direction of bath rooms, sanitary, cleanly and wholesome surroundings.

A few years ago, in the average town of this country, the young man's ideal was to have a good horse, a buggy and a ten dollar whip; but his clothes were of secondary consideration. Then our tailors started picturing good looking, well-dressed young men around the town, and to-day they have changed the thoughts of young men everywhere, and they wear well recognized brands of clothing, their care in personal appearance has brought with it self-respect in other things. Advertising needs your fostering attention and development in the consideration of the efficiency movement. It is a power for good, a power for practical education and a power for industrial activity."

So writes Wm. H. Ingersoll in his paper on Advertising, which appears in the first volume of Transactions of the Efficiency Society, Inc., a volume containing matter of great value to all men, no matter what their life's work may be.

* * *

Where Carbon Boils.—It is held that when an electric arc light hisses, the carbon, melted from one of the rods, is actually boiling in the little crater formed in the end of the rod. The superheated liquid, with blinding flashes of light, moves and jumps about very much as water does on beginning to boil.

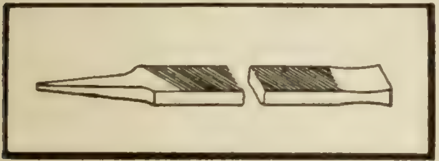
MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

PREVENTING SORE THUMBS WHEN FILING.

By J. E. Cooley.

IT is commonly known among those who do any considerable amount of filing on a lathe, that the constant handling of the file rubs the skin from the thumb, and makes it very tender. Many machinists use a thumb-glove, or a square piece of leather having a string tied across so that it will slip over on the thumb. While these serve their purpose well, they are clumsy, besides they are in the way when putting in or removing the work from the lathe. If the file is ground slightly, concave on the end, as shown in the sketch, there will be no more sore thumbs. The teeth on the extreme end of the file are useless in lathe work any way.



PREVENTING SORE THUMBS WHEN FILING.

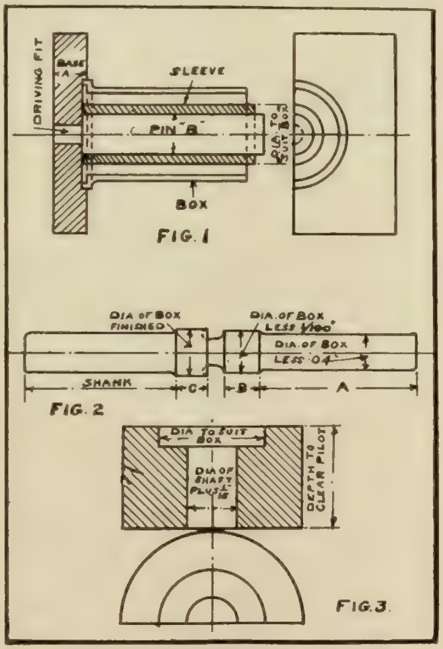
BABBITTING AND BROACHING BEARINGS.

By George Black.

IN babbitting bearings it will frequently be found when the bearing has cooled that despite the careful preheating of the box, the anti-friction metal is loose therein, due to shrinkage. The obvious remedy is to expand the metal into the box, thereby making it solid, and this is accomplished, as a rule, by "peaning" the babbitt with a hand-hammer—at the best an unsatisfactory job. With the assistance of the jig for babbitting, and the tool for expanding the metal and subsequently broaching the bearing, here described, a first-class job is effected, the metal in the bearing being solid, the exact size required, and with a glass-like finish. The method is particularly applicable to the solid bearing boxes of armatures and the heavy split type of axle box bearing, but can be applied to any bearing which is faced on one end, and where the box is sufficiently strong to resist the bursting strain incidental to expanding the metal.

Fig. 1 shows a section of the jig used for babbitting. (A) is the cast iron base which is recessed for the end of the box to fit into, and bored a driving fit for a mild steel center steady pin; (B), the sleeve; (C) is of steel, and is made a sliding fit on (B), while the length of the sleeve is one inch longer than the longest box to be babbitted. The outside diameter is made to suit the various diameters of shafts, less 3-64 in., and has a slight taper from the bottom to the top of 1-32 in. per foot; this taper facilitating the withdrawal of the sleeve from the box after babbitting. It will be noticed that the bottom of the sleeve is cupped out, leaving a bearing 1-16 in. wide at the edge. This was done to allow the sleeve to sit down snug on the base plate (A) and prevent the metal running under the sleeve. The method of using the jig is as follows:—

Select the size (outside diameter and length) of sleeve suitable, and slip over center pin of jig. Place box in position and fill with babbitt. As soon as the metal has "set" lift up box—the sleeve coming with it, and turning it end for end, jar the small or top end of the sleeve against the bench or a block of wood, and the bearing will start from the sleeve, allowing the latter to be withdrawn and replaced on the jig ready for the next box, and leaving the box which has been babbitted ready for the next operation of expanding and broaching. The combined expander and broach is shown in Fig. 2. (A) is the pilot, which is of sufficient length to ensure alignment of broach and bearing. The diameter of (A) is 1-16 in. less than the required diameter of box. The upper part (B) of the pilot is the expander proper, and its diameter is 1-100 in. less than the required finished diameter of box. Immediately following the expander will be noticed the cutting edge of the broach (C), which is of the required diameter.



BABBITTING AND BROACHING BEARINGS.

Fig. 3 shows the cast iron blocks used to center the bearing and support the anti-friction metal during the broaching operation, which is performed with a hydraulic press. Unless the anti-friction metal is so supported, there is a tendency to break its edge away when the broach is coming through. Bushes can be made to suit different diameters of broaches to fit the block in Fig. 3. The use of this tool needs no explanation, and a first-class job in all respects is the result, with about one-quarter of the time only necessary, as compared with the old method.

* * *

TO PROPERLY KEY A PULLEY.

IT is something of a trick to key a pulley so that it will not work loose after a time, especially if the pulley is large, and runs at a high rate of speed. In making the key, care must be taken that it be of uniform width, and fit the seat in the shaft and the pulley snugly. The key should be driven tight, but not so tight that it will kink under the blow. If the pulley runs with the hub against the box, which is the usual way, allow only about 1-32 in. end play between the box and the pulley.

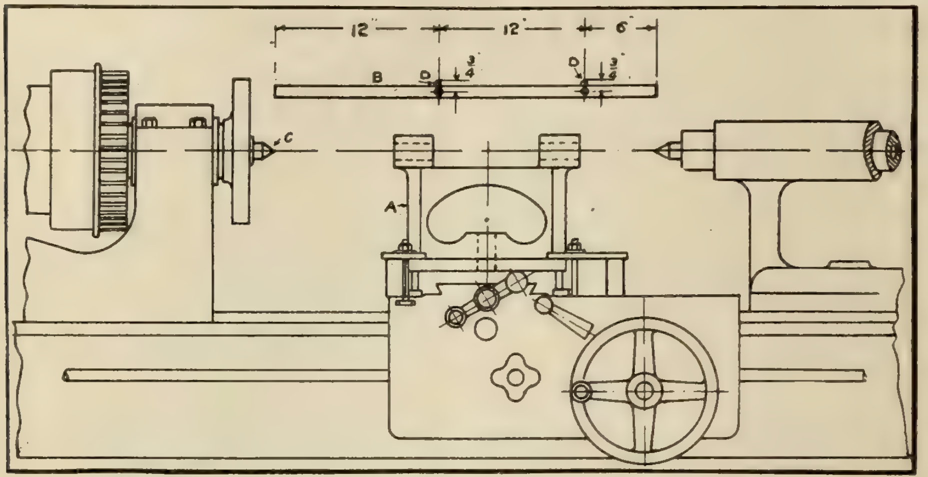
When an old key is worn too thin, but fits properly otherwise, place a strip of tin under it to make it fill the keyway closely. To draw a key, a small end of which is projecting, hold it with a pair of pliers, pry against the hub of the pulley, at the same time driving the hub on the shaft with a hammer. This will loosen both the pulley and the key. If the key is cut off flush with the pulley, it may be necessary to remove the shaft and drive from the inside, in which case it is well to drive the pulley on a little, to loosen the key.

* * *

SOLUTION TO BORING PROBLEM.

By A. P. C.

THE problem in boring, appearing in the June 26 issue of Canadian Machinery is one likely to give rise to an interesting discussion by men in our machine shops, and argument, such as this apparently simple question brings out, is always beneficial. While most of the men, primarily interested, if not all, are now convinced as to the final answers to the several questions involved, mechanics at large might be interested to have our views on the subject.



A PROBLEM IN BORING—SEE LAST WEEK'S CANADIAN MACHINERY.

(1)—In the first place it would be practically impossible to line the work up with the centres out of true, because in setting the surface gauge to the proper height, which centre could you use? For accurate boring, the centres must be in line, both vertically and horizontally in relation to the shears of the lathe, or the travel of the saddle.

(2)—Fig. 1 shows an exaggerated sketch of the question under consideration. The length of the boring bar being 30 inches. The difference in height of the two centres is 1-16 inch, and if X=the difference in height of the two tools, then

X : 1-16 : : 12 : 30 or
X=1-16×12-30=1-40=.025 inch.

(3)—Therefore, the right hand hole would be .025 in. higher than the left, although parallel with each other and parallel with the base.

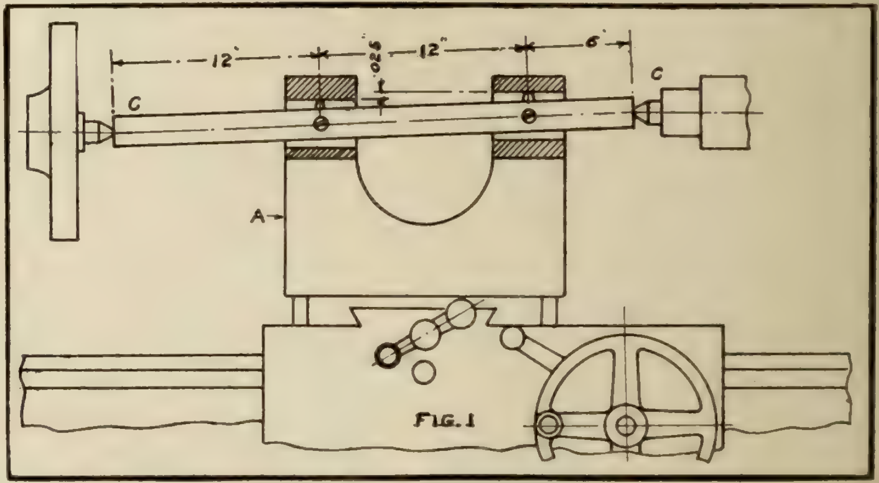
(4)—As the bar has no traverse motion, being revolved upon the centres, and the tools will always remain the same radius from the centre of motion, therefore, the holes cannot be tapered.

(5)—Their true cylindrical form brings to a somewhat finer point of argument. Some may say that the holes would be round, or as round as it is possible to get them. While this is true, and the error almost infinite—— yet, with the centres out of alignment, it must surely be there, Just the same. The angle of inclination that the boring bar makes with the lathe shears, or saddle travel, can be found by the formula:—

$$\text{Size of angle} = \frac{\text{Side opposite}}{\text{hypotenuse.}} = \frac{.0625}{30} = .00208, \text{ or } 7' \text{ nearly.}$$

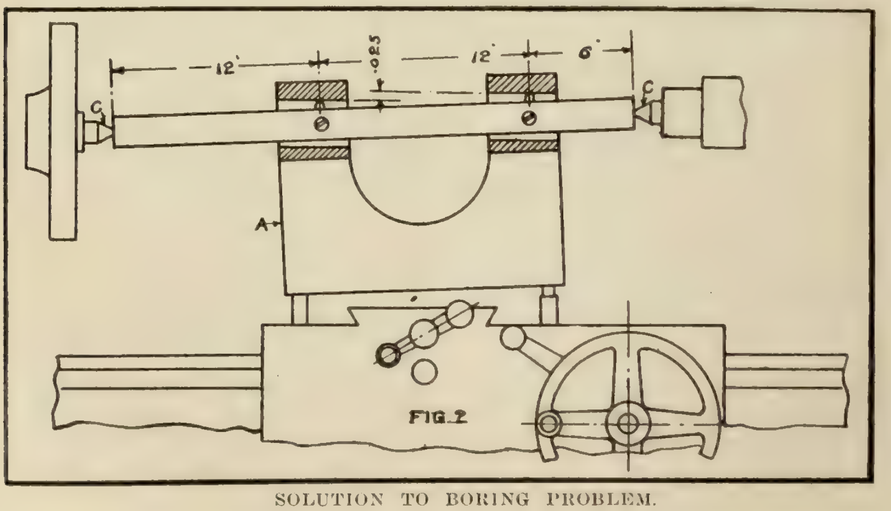
It will be seen by reference to Figs. 3 and 4, that the cutting angle of the tool in relation to the work is continually changing while the bar revolves. The cutting tool always remains at right angles to the axis of the bar, but while it is at right angle to the axis of the holes when in a horizontal position, Fig. 4, it is at an angle of nearly 7 deg. with the axis of the work when in a vertical position, Fig. 3. The hole will, therefore, be slightly smaller vertically than it will be horizontally.

(6)—It might be possible to set the work up by using the boring bar, but, with the centres out of alignment, the work would require to be raised and a strip inserted as shown in Fig. 2, thus bringing the base out of parallel with the saddle travel. In this case, the holes would be parallel with each other, but not with the base, and would be out of line .025 inch.



SOLUTION TO BORING PROBLEM.

(7)—By using one cutting tool to bore both holes, a more satisfactory job would result, as the holes would be in line with each other and parallel with the base, but the error would still remain as regards their cylindrical accuracy.



SOLUTION TO BORING PROBLEM.

* * *

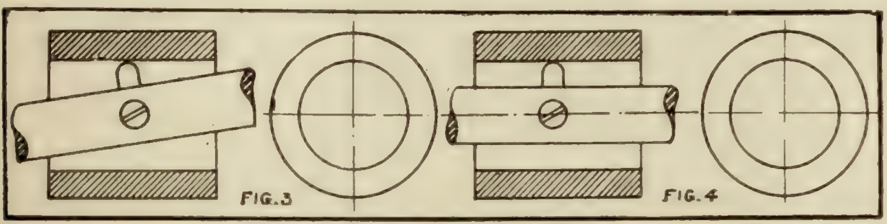
A RIVETING MACHINE.

By S. Baker.

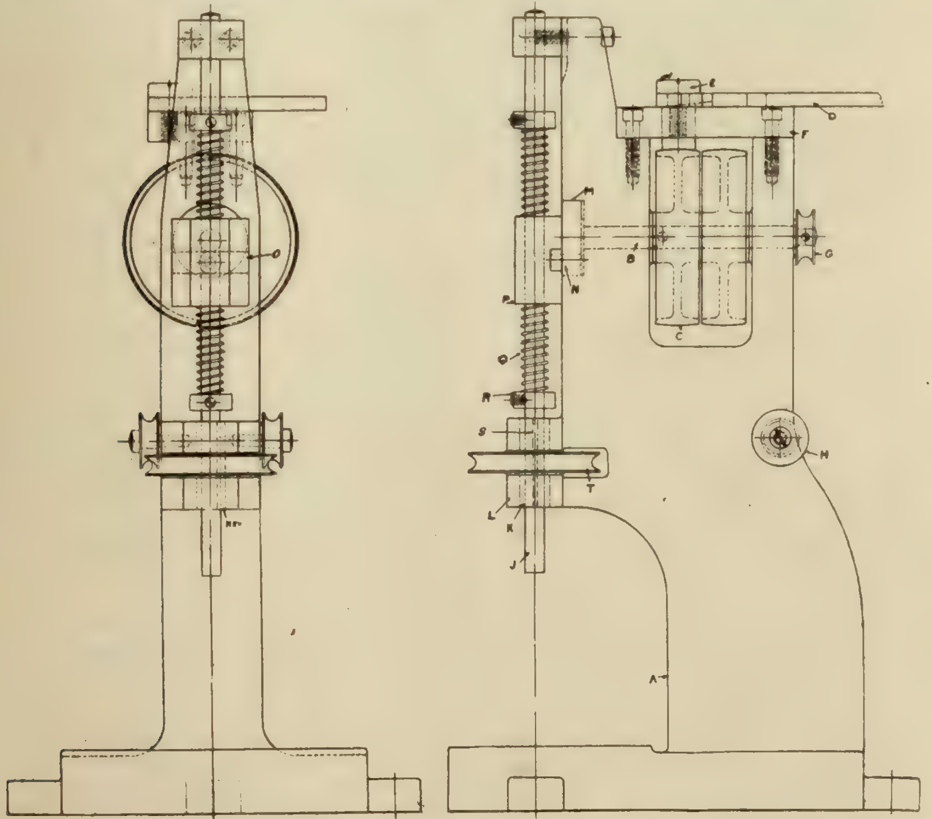
THERE is shown in the accompanying strations, a special riveting machine which was developed in a shop having a great deal of light riveting to do. The machine shown is very rapid in operation, and strikes a light or heavy blow as required, having adjustment provided for this purpose.

The frame of the machine consist of a casting (A) provided with lugs for fastening it to the bench, and through the upright portion of the frame, there extends the shaft (B) which carries the operating elements. To the shaft (B) are fitted loose and tight pulleys (C), over which the flat belt from the countershaft is led. The belt shifter (D) is secured to a plate (F) at the top of the frame, by the pivot screw (E). To rotate the shaft or spindle (J) which carries the hammer (not shown), a pulley (G) is provided on the end of the driving shaft (B), and a round leather belt passes over this pulley to two pulleys (H) on the sides of the frame (A) and to a pulley (I) on the spindle (J). The pulley (I) is placed between lugs (L) which are bushed with hardened bushings (K). As the key (S) is driven and soldered in the spindle, but slides freely in the key way in the pulley (I) the pulley can rotate the spindle while it moves up and down.

The spindle moves up and down as follows: The enlarged end (M) of the shaft (B) has a pin and roller (N) set off centre, which work in the groove (O) in the operating cam (P). As the driving shaft revolves, the pin and roller (N) move the operating cam up and down, and the spindle with it. The operating cam is not secured tightly to the spindle, but between the cam, and two adjustable collars (R), are two compression springs (Q) which are so set as to balance each other, and thus allow the operating cam to move the spindle up and down. The purpose of the springs is that should the work be held too high while the machine is in operation, the spindle would not come far enough down to either break the machine or the work, but after it had come down far enough to engage the work, the springs would simply be compressed. Also, as the work flattens out under the hammer, it is necessary for the latter to descend further each stroke in order to reach it. This arrangement allows the stroke to be self-adjusting, while the work is held in the same position. The machine shown has proven highly satisfactory during several years continuous use.



SOLUTION TO BORING PROBLEM.



A SPECIAL RIVETING MACHINE.

REVIVING A SMALL STORAGE BATTERY.

CHARGE the battery as rapidly as is possible to send current into it without overheating. The resistance being greatly increased by the effect of the sulphate, the cell will become hot when charging. Use a thermometer to test the temperature, and maintain the current at such a value that the temperature of the cell does not exceed 110 deg. F. Continue this charge until the plates begin to gas freely, then reduce the rate of charge to the normal rate and continue this until the plates again begin giving off gas. The rate of the charge should be reduced to half the normal rate, and continued until further gassing again occurs. The cell should then be partly discharged, and the treatment repeated. This cycle of operation may have to be carried on for some time.

* * *

SAFEGUARDING OVERHEAD TRANSMISSIONS.

By Fred. A. Barker.

OVERHEAD transmission is not as remote or as free from danger as we oftentimes are led to believe. It is true that many well-regulated factories have rules prohibiting persons from oiling or working on overhead transmission, while it is in motion, but these rules, good as they may be, cannot always be practically enforced. Belts will run off pulleys; and hangers, clutches, collars, couplings and bearings will get out of order. Intelligent care and close inspection are necessary, but unfortunately the practice is more often to look after machinery when it is in motion than when it is still.

Platforms and Walks.

Guarding cannot be absolutely complete on overhead transmission; we, therefore, should endeavor to provide as safe means as possible in getting at the necessary parts. Platforms and oilers' walks should be conveniently placed along shafting wherever possible. These not only allow better opportunities for inspection, but are far safer than some portable means of getting at necessary points. Guard rails and toe boards should be provided on all such platforms.

Pulleys.

Ample space for belts should be allowed between two pulleys, or between pulley and hanger. Belt rests in the form of hooks can well be placed between pulleys or pulley and hanger, and will prevent the belt from wedging or resting on the revolving shaft. If two pulleys are very close together, and no such belt rest can be provided, the space between them can be filled up with a wooden pulley of the size of the regular pulleys, or of a smaller one of the two. Pulleys situated near hangers or other places requiring access can be guarded with stationary guards on the side and supported from overhead. Pulleys can also be webbed on the sides to prevent contact with spokes. Protruding set screws in the hubs of pulleys are a well-known source of danger and can be practically eliminated.

Horizontal and Idle Belts.

Long and high-speed overhead horizontal belts are oftentimes situated directly above persons working or passing underneath them. The breaking of such belts is liable to cause serious accidents. They can be effectively guarded with substantial and well-supported guards placed underneath. Great care, however, should be exercised to design such guards of sufficient strength, otherwise the additional danger is introduced of pulling the guards down with the belt. Guards are often made in the form of a channel in which the lower portion of the belt runs; this forms additional protection in preventing belts from running off pulleys.

Belts when removed from the driving pulley on shafting should never be allowed to hang loosely on the shaft; they may bind and wrap around the shaft with serious results. Idle belts often hang below in a dangerous manner to those nearby.

Shafting, Clutches, Collars, Couplings.

It is not practical, except in rare cases to cover shafting completely; however, points at which frequent access is necessary should be covered with guards of wood sheet metal, wire mesh, or such other special material as may be easily obtainable, depending upon the character of the shop. Protruding parts or clutches, couplings, and collars should be effectively covered or eliminated.

---

HANDLING MEN.

SOME executives think that men need disciplining pretty frequently in order to make them do the right thing. In handling men, they neglect the most important factor that determines their actions—the mind. They forget that in order for a man to serve, he must have the desire to serve. Handling men properly should merely be a matter of hiring and firing.

A man should be told what is expected of him, what the policy of the house is, and when he makes mistakes, as all of us do, he should be set right in a friendly way and given another chance. Calling him down harshly does no good. It only engenders ill-feeling towards the house, and kills the spirit of loyalty and cooperation. If he does not fit into your organization after having been given a fair trial, if he does not do his work conscientiously without being watched, he is not worth his salary, and should be fired. Such a man is evidently in the wrong line of work, and it is no real kindness to him for you to retain his services when it is so evident that he needs constant supervision in order to be made to do his work.

The man who needs a boss is not needed by the boss, and the employer's time is too valuable for him to waste it watching men who need watching. Such men will either fit into your organization, or they will not. If they are of the former class, they will be loyal to you, provided you handle them like human beings, and not as rogues. On the other hand, if they belong to the latter class, no amount of cussing and "calling down" will make them loyal, and a man who is not loyal wil not, and cannot give you the best that is in him. Therefore, the only simple, sane, logical and clean-cut thing to do is to fire him.

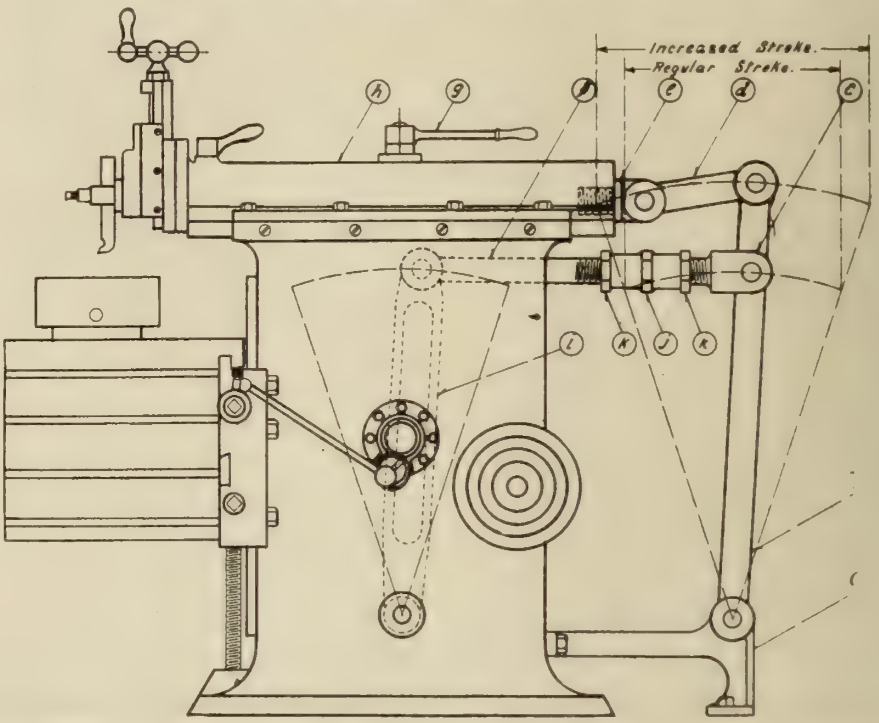
Life is too short and competition too severe, for you to mince matters with the man who cannot fit into your organization. There are too many good men hungry for the opportunity of working for you, and who will not need much supervision, for you to hold on to the men who need a boss.—Can. Indus. Review.

INCREASING THE STROKE OF A SHAPER.

By J. H. R.

SOMETIMES a piece of work is wanted to have a surface or slot shaped of a length which exceeds the stroke of the shaper by a few inches, and in many cases (especially in jobbing shops) the work must be done at two settings or taken elsewhere. The accompanying sketch shows a method which may prove of service to those who may have such a problem presented.

The bracket (a) is secured to the back of the frame, and also to the floor. The lever (b) is fulcrumed in a fork of the bracket (a) and the upper end connected to the ram by the link (d) and the stud (c). The upper connection of the oscillating lever (i) is disconnected and replaced by the adjusting link (f), (c). The work, having been placed in position as nearly as possible to meet the increased stroke of the shaper, and closer adjustment being made with the adjusting nut (j) is locked in position with the nuts (k) (k).



INCREASING THE STROKE OF A SHAPER.

Care must be taken that the increased stroke does not interfere with the travel of the ram.

Industrial and Construction News 19-23

THE INDUSTRIAL OUTLOOK.

DOMINION DAY, 1913, will have come and gone, ere this issue, No. 1, Vol. X of Canadian Machinery reaches its subscribers, yet, its epoch marking feature is such as to afford opportunity for an expression of opinion on the near future Canadian industrial outlook . For some months past, a rather pessimistically inclined prominence has been given this subject, and, unfortunately, by men who ought to know better. Tight money, existent and prospective, is the bogey we meet at every turn, and whatever other opinion we may hold, as to the amount of reality contained in the outcry, there is unanimity of opinion that its sponsors are playing the scaremonger part to the utmost limit.

Canada is, without doubt, influenced by domestic and industrial unrest prevailing in other countries, but why in Heaven's name should her public men become paralyzed and panic-stricken, or become opportunists on this account. It would seem to be the rule that the tendency to, or accomplishment of a "Panic" in the United States is the signal for a like condition of things here. A let-up in the demand for iron and steel is sufficient data on which to build a tale, and spread broadcast that "the bottom has fallen out of the market," and the unfortunate thing about the affair is the fact that nine out of every ten people believe the yarn, and never dream of investigating or analyzing the constituent details, even should these exist. Consumption, present and near future, of iron and steel is not such as to materially lessen demand, and in diagnosing the situation, heed should be given to the circumstance that our country's growth and development is of a continuous and permanent nature, and that in keeping up with it, in the matter of mills and factories, record outputs are periodically made. On the other hand, as our factory installations, extensions and enlargements are designed to cover normal periods some time ahead, and when these go into operation and overtake previously "impossible-to-fill" demands, now and then, a point is reached at which capacity more than supplies even normal demand. Such a situation, of course, must and does right itself, and without the aid of professional panic spreaders. The position at the moment sems to be that equipments are now in shape to handle normal outputs, and consumers being aware of this fact have ceased to make reservations of tonnage for any extended period ahead.

The U.S. Tariff Bill is at the present time looming largely in the sphere of industrial enterprise, and its effect on becoming law is more or less uncertain. Withal, we do not look for any abnormal disturbance in the American steel, iron and kindred trades, as conditions, so far as we can gather are on a particularly sound footing, apart from the Tariff feature, and unless those concerned "create" a crisis, should the latter not be to their liking, there is nothing in the industrial outlook to give cause for anxiety.

A contemporary, in close touch with the steel trade, expresses doubts as to skyscraper buildings for office purposes, keeping up the pace of recent years and opines that commercial buildings in the near future will take the form of modern lofts and warehouses. Heavy structural shapes will, therefore, be in less demand, and more highly finished steel materials, such as fire-proof furnishings, hoisting and haulage equipment, conduit and ventilator fittings, etc., will, instead, be required. Reinforced concrete construction would, of course, be the feature of such buildings. The tremendous development which is taking place in all branches of power equipment, steam, electrical and hydraulic, must also be reckoned with in any observations on the industrial outlook, and here there is no sign of slackening up.

Taken all in all, instead of inhaling the atmosphere of pessimism with resignation, as it were, we, in Canada, have every reason to be extreme optimists, and to realize that, while in our growing days, we are perhaps more liable to be influenced by happenings external to us, such a probationary period gives the opportunity to mould the material of which men are made.

◆

SERIES OF ARTICLES ON SCREW CUTTING.

BEGINNING with the July 10 issue of Canadian Machery, a series of Articles on Screw Cutting will appear each week thereafter, and as the writer is an expert mechanic and has been accustomed to instruct students from the practical and easily intelligible standpoint, the attention of apprentices and others who desire to acquire a knowledge of the art from the bottom up, is directed to the forthcoming series.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON.

	Per Ton.	
Foundry No. 1 and 2, f.o.b., Midland	$19 00	$19 50
Gray Forge, Pittsburg	....	14 65
Lake Superior, charcoal, Chicago	.....	16 25

	Mont'l.	Tor'to.
Canadian f'dry, No. 1	$21 00	$20 00
Canadian f'dry, No. 2	20 50	19 50
Middlesboro, No. 3	23 50	23 50
Summerlee, No. 2	25 00	26 50
Carron, special	25 00	.....

Cleveland, No. 1	24 25	25 00
Clarence, No. 3	23 75	24 50
Jarrow	.....	25 50
Glengarnock	.....	26 00
Radnor, charcoal iron	30 00	34 50
Ferro Nickel pig iron (Soo)	.....	25 00

BILLETS.

	Per Gross Ton.
Bessemer billets, Pittsburgh	$26 50
Open hearth billets, Pittsburgh	26 50
Forging billets, Pittsburgh	34 00
Wire rods, Pittsburgh	29 00

FINISHED IRON AND STEEL.

Per pound to large buyers:

	Cents.
Common bar iron, f.o.b., Toronto	2.10
Steel bars, f.o.b., Toronto	2.20
Common bar iron, f.o.b., Montreal	2.15
Steel bars, f.o.b., Montreal	2.25
Bessemer rails, heavy, at mill	1.25
Iron bars, Pittsburgh	1.65
Steel bars, Pittsburgh, future	1.40
Tank plates, Pittsburgh, future	1.45
Beams, Pittsburgh, future	1.45
Angles, Pittsburgh, future	1.45
Steel hoops, Pittsburgh	1.60

Toronto Warehouse f.o.b., Toronto.

	Cents.
Steel bars	2.30
Small shapes	2.45

Warehouse import, freight and duty to pay:

	Cents
Steel bars	1.95
Structural shapes	2.05
Plates	2.05

Freight, Pittsburgh to Toronto:

18 cents carload; 21 cents less carload.

BOILER PLATES.

			Mont'l.	Tor'to.
Plates, ¼ to ½-in., 100 lbs.			$2.35	$2.35
Heads, per 100 lbs.			2.65	2.95
Tank plates, 3-16 in.			2.60	2.60
Tubes, per 100 ft.,		1 inch	9.00	8.50
"	"	1¼ in.	9.00	8.50

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, June 28, 1913.—The activity in machine tools and kindred lines has steadily continued and is increasing. A few nice railway orders have been placed recently, and the whole situation seems optimistic and encouraging. Big railways are buying heavily in the States and bridge companies have orders for much structural steel. Thus, all the primary indications are for liveliness everywhere. Two or three of the big supply houses in Montreal report spleudid sales during the past week, and they say that more good business is in sight. Locomotive builders are receiving new orders every day, so the report goes, and orders for bar iron naturally go forward as soon as warrant is given of turnover . The C.P.R. have announced a very extensive expansion policy, and on the word of its president, they are to spend over a million dollars at once. This means confidence, and confidence is the watchword for the West .

Pig Iron and Copper.

Low prices still prevail in pig iron, but this, of course, has had the natural result of developing larger buying in certain sections of the industrial field. From the United States, it is reported that most of the activity is in the East, yet some rumors have come forward of sales in the Central West, at extremely low prices. Unsettled feeling exists both with consumers and producers, and it is generally conceded that this state of affairs will continue for some time at least throughout July. Copper is dull, and the demand for refined has been small from domestic consumers . Nominal prices have ruled, but a firmer tone has been noticeable for a day or two. Electrolytic was weak right along. Little business was reported from Europe, and certain industrial conditions in Europe do not seem encouraging in this connection.

Some American reports state that there is a bearish element extant in the older countries, and that 13 cent copper is in sight by November. Local people put no faith in these predictions. Lead is quiet and steady, while refined spelter awakened a little and showed some activity—the first for a long time, August and September offers for spelter being higher considerably. Due to the tumble in tin a week ago, grave reports went all over the world that owing to the heavy decline, the big United States tin mills were to close. This was not confirmed, however, most of these concerns being working to capacity. Still it is well known that new business has not been coming, a state of affairs verified by the independent mills. Our price is cut to $43, and the probabilities are for a still lower market. Nothing is doing in old material, and things remain normal.

Toronto, June 30, 1913.—The Canadian Fairbanks-Morse Co., Ltd., have had a remarkably good month, taken all round. Their machine tool department found things rather quiet, but other lines made up for this. The A. R. Williams Co., whose chief business is done in machine tools, are finding business rather slack just now. The C. P. R. are beginning to place orders for a large number of machine tools, to be used in their shops between Toronto and Vancouver. Some of these orders were received by the A. R. Williams Co. last week. The Dominion Bronze Co., Preston, Ont., have half completed their new plant in Preston, and will place orders for about $20,000 worth of machine tool equipment this week. They will manufacture car fittings principally, the company being associated with the Preston Car and Coach Co.

Pig Iron and Steel.

Better business and lower prices in pig iron were reported from steel centres in the United States last week. The same cannot be said of business on this side. Conditions were just the reverse. Thresher manufacturers are the chief buyers of pig iron and steel, but they are not taking what they contracted for. The implement men anticipated a bumper year in 1913, but so far they have been disappointed. The financial situation prevents them from sending the machinery West, for which they bargained. Deliveries are such now that manufacturers are placing orders with agents for bars, shapes, etc., from the United States Steel Corporation, whose base price is $1.45 at the mill. The entrance of a big Eastern steel concern into the local market has complicated matters somewhat. Their agent is reported to be quoting and cutting steel bar prices, and is in line to get big orders.

Metals.

The collapse in the metal market last week did not resuscitate the local market one bit. Prices remain the same as quoted last week. Business is at a standstill, and is likely to remain so. The price of copper wire was not affected by last week's change.

BRITISH MACHINE TOOL IMPORTS AND EXPORTS.

MACHINE-TOOL imports by Great Britain for May were valued at $233,255, or more than double the total for May, 1912, which reached $114,365. In May, 1911, the imports of machine tools were valued at £21,976.

The export figures were as follows: May, 1911. $305,170; May, 1912, $325,165; May, 1913, $388,335. The value of machine-tool exports for the first five months in each year were:— 1911, $1,452,845; 1912, $1,785,620; 1913, $2,135,905.

Exports of machinery generally during May showed a gratifying advance, the total being $16,279,880.

DIRECT EXPANSION vs. BRINE.

THE direct expansion of a refrigerating liquid or gas through piping directly in the space to be cooled has its advantages, and necessarily it has its disadvantages. The advocates of direct expansion sometimes forget its disadvantages and recommend it for all classes of cold storage and refrigerating work.

Brine circulation has advantages over direct expansion, and it has disadvantages, but generally speaking, the advantages of brine circulation preponderate so greatly, that brine is commonly recommended for general cold storage work. The advocates of brine circulation perhaps carry it a little too far, and sometimes do not favor the use of direct expansion for any purpose.

As between these two extremes, it may be stated that direct expansion is valuable for low temperature work, for quick cooling of warm products, and for the less sensitive classes of cold storage work. Brine circulation for comparatively high temperatures and for a nice control and adjustment of temperature cannot be compared with direct expansion. Therefore, brine circulation has its uses, and direct expansion also has its uses, but brine is best for most purposes.

SCOPE AND EFFICIENCY OF MACINE TOOLS.

THE use of machine tools is often carried into much greater detail in works which are not strictly engineering works, than in actual mechanics' shops. There is a certain unwillingness to get away from the power driving tool proper, and instal a series of machines which have a very restricted scope, though a very large capacity, for work. Many excellent workshops could, however, be improved in profit-earning capacity by a score or more of special machine tools.

The works that only turns out motor cars or bicycles or some special article is, of course, the place where the largest proportion of work can be done by detail machines. In these places, again, two faults are noticeable. The common universal turning lathe is often absent altogether, and there is a tendency to get machines which can be adjusted to a certain variety of work. Once there is work for it, or in practice an average half-day's work for it, the more limited the range of a machine tool, the better it will serve its real purpose. All adjustments and enormously to the size, wearing parts, and floor space of a machine. Very often they also impair its possible accuracy, and rapidity of output.

There are very many branches in which machines could be simplified, improved, and cheapened if the engineers were called upon to design for a much more restricted scope of work. It is quite a common thing to see a row of special lathes with two or three feet of bed and several speeds, and many other "advantages" that are never used. Once depart from the generally useful machine, and the further specialization is carried the better. There is still considerable room for improvement in this matter, and it is for the buyers and users of such machines to determine clearly that they will carry a good principle to its logical conclusion. At the same time, no workshop, however limited, in its range of product, should be without some examples of the lathe—properly so-called.

OVERTIME.

JUST now, when trade is good and most shops are full up with orders, this question demands careful consideration of means to reduce it as much as possible. On one side there is the necessity for output to time, everybody requiring urgent delivery, and in the case of penalty orders, the specified time is the first consideration. A second reason for overtime, especially in the machine shop, is sometimes the lack of capital to invest in new machinery, or in the event of capital being available, the difficulty of seeing a continuance of orders to justify the expense, as the larger the plant the greater the overhead charges during the slack time, the smaller business having to stand a larger percentage of overcharges than when the shop is full of work. Thirdly, comes the question of floorspace, affecting firms which have expanded to the limit of the ground at their disposal, and careful consideration of future orders is required before more ground is obtained.

Overtime on Repair Work.

Fourthly, overtime is always allowable where repairs are concerned. Trade unions recognize this in their rules, and do not restrict their members when overtime is necessary in that depart- engaged in this class of work. Finally, ment which is behind in output, and may cause other departments to work short time, which not only restricts the works output as a whole, but tends to loss of good men; as the best men will look for another job if they see the possibility of continual short time before them; this final reason only being applicable when reasons two and three hold good.

Effect of Overtime on Profits.

Overtime involves increased rate of cost of manufacture, and consequently less profit. The actual labor cost is higher on account of the men being tired after their day's work and not being able to keep up the same pace. Then, there is the extra pay for overtime rates, besides the cost of light which would not be necessary during the day. If there is sufficient work, the best plan is to work a night shift, as the men are fresher and the payment is slightly less, and there is no time and a-half to pay. It is well to look into the possibility of the possibility of the present orders paying for the installation of new machinery—that is, of course, if capital is available—as, in any case, the overtime rates will be saved, the work got out quicker, and the machinery stands at its full value in the balance sheet for the current year.—Machine Tool Engineer.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Sydney, N.S.—No. 2 ore pier of the Dominion Iron and Steel Co. was damaged by fire, June 22nd, the loss exceeding $1,000.

Hamilton, Ont.—Stewart & Wilton are architects for a Foundry and Storage warehouse to be built for the Otis-Fenson Elevator Co.

Fort William, Ont.—The National Boiler Works Co., of Superior, Wis., will erect a boiler and structural manufacturing plant in this city.

Beaverton, Ont.—The Foundry, which was operated here for 30 years by Wm. Smith, has gone into the hands of J. M. & J. O. Reid, of Oshawa.

Fredericton, N.B.—The I. C. R. will locate roundhouse and shops here to handle Canadian Eastern and St. John Valley Railway divisions.

Berlin, Ont.—The Berlin Gasoline Engine Works narrowly escaped destruction on Wednesday, June 25, when fire destroyed the roof of the factory.

Medicine Hat, Alta.—The Medicine Hat Pump and Brass Mfg. Co. will purchase about $50,000 of new equipment for its factory. W. G. Nesbitt, manager.

Sarnia, Ont.—The Doherty Mfg. Co., Ltd., makers of stoves, are constructing an addition to their plant, which should be ready for occupancy by July 10. James Doherty, general manager.

Selkirk, Man.—The Manitoba Rolling Mills, now located at St. Boniface, is making arrangements to move to Selkirk, where it proposes to erect a plant at an ultimate cost of $500,000.

Hanover, Ont.—The Fisher Machinery Co., Ltd., general iron founders and manufacturers of wood working machinery, have recently built a new foundry, which is now in operation.

Preston, Ont.—The Preston Car and Coach Co., Ltd., are building four erecting shops, equipped with air and steam, but without any machinery. Each shop is 60 by 200 ft. long, with three tracks each. This will give floor space to erect 24 steam coaches or 50 street cars. Don. M. Campbell, general manager .

Toronto, Ont.—A. B. Ormsby Co. Ltd., makers of steel window sashes, have nearly completed their new plant at the corner of King and Dufferin Streets, and part will be occupied by the firm in August, and the balance in October. The equipment has not yet been decided upon. C. J. Hale, Toronto manager.

Gananoque, Ont.—Cowan & Britton, makers of nails, hinges and butts, who were reported to be trebling their plant, have been unable to complete their plans to start work this year, but will commence building next spring. R. H. Britton, manager.

St. John, N.B.—T. McAvity & Sons, Ltd., makers of plumbers', steamfitters' and engineers' supplies, expect to complete plans for their new plant by the middle or end of this month, and to proceed at once with actual construction. Some time has been lost closing up details for purchase of site.

Niagara Falls, Ont.—Representatives of the Blystone Manufacturing Co., whose headquarters are at Cambridge Springs, Pa., were here last week looking for a site for a branch factory. The visitors were W. G. Wright, Meadville, Pa., Luther G. Conner, Pa., and D. Blystone, Cambridge Springs, Pa. The company manufactures cement mixing machines.

Saskatoon, Sask.—Work began last week on the plant for Marshall's, Ltd., Gainsborough, Eng., manufacturers of farm machinery. H. E. Lambe, managing director, says the buildings will cost $30,000 to $40,000. The main building will be constructed of brick and steel,

PROBABLE EQUIPMENT REQUIREMENTS

The undernoted firms are now, or likely to be soon in the market for new equipment, etc. For fuller details, reference should be made to the news items:

Machine Tools.

Blystone Mfg. Co., Cambridge Springs, Pa.

A .B. Ormsby Co., Ltd., Toronto, Ont.

Intercolonial Railway, Ottawa, Ont.

Esquimault & Nanaimo Ry., Nanaimo, B.C.

Medicine Hat Pump and Brass Mfg. Co., Medicine Hat, Alta .

School Board, Edmonton, Alta.

National Boiler Works Co., Superior, Wis.

Victor Saw Works, Hamilton, Ont.

Imperial Iron and Steel Corporation, Prince Albert, Sask.

Electrical Equipment.

City Council, Berlin, Ont.
Town Council, Yorkton, Sask.
City Council, Winnipeg, Man.

Water Mains.

Village Council, Hespeler, Ont.

Electric Generators .

Town Council, Merritt, B.C.

Gas Mains.

City Council, Berlin, Ont.
The Consumers Gas Co., Toronto, Ont.

Foundry Supplies.

Otis-Fensom Elevator Co., Toronto, Ont.

School Board, Edmonton, Alta.

Excavating Machines.

Waterworks Commission, Winnipeg, Man.

Refrigerating Machinery.

The Mainland Ice and Cold Storage Co., Vancouver, B.C.

Waterworks Equipment.

Waterworks Commission, Stratford, Ont.

Electric Water Pumps.

Water Commission, Oshawa, Ont.

Heating Systems.

School Board, New Westminster, B.C.

Woodworking Equipment.

John A. McLean, Wingham, Ont.
School Board, Edmonton, Alta.
British Canadian Lumber Corporation, Ltd., Port Renfrew, B.C.

and will be 150 feet by 130 feet. The office building will be a two-storey structure, 50 by 50.

Walkerville, Ont.—F. W. Vollans Co., Ltd., makers of welding machines, who have their plant in operation now, will build a large extension shortly.

Port Colborne, Ont.—The Buffalo Union Furnace Co., manufacturers of pig iron, Buffalo, N.Y., who are building a blast furnace here, expect to begin operations in August.

Prince Albert, Sask.—Work on the plant of the Imperial Iron and Steel Corporation is likely to start at once. James Kreis, consulting engineer, Chicago, has been in Prince Albert in connection with the undertaking.

Hamilton, Ont.—The Massachusetts Saw Works, of Springfield, Mass., will locate a branch factory here, to be known as the Victor Saw Works, Ltd. They will make "Victor" hack saws. The Hamilton plant will be operated as an entirely separate industry. They have leased a two storey building, which will be thoroughly renovated. When running at full capacity the factory will employ about 75 hands.

Electrical

Hamilton, Ont.—The Hydro-Electric department for four months this year shows a surplus of $2,523. The department has 3,859 customers.

Yorkton, Sask.—The town asked the ratepayers on June 20 for permission to spend $140,000 on an extension to the electric plant.

Tweed, Ont.—The municipality has entered into an agreement extending over 10 years with the Tweed Electric Light & Power Co., for the supply of power.

Hamilton, Ont.—Mayor Allan is in favor of building a transformer station on the Beach, through which to pass Toronto and Niagara Power Company's current, in case of trouble on the Hydro lines.

Berlin, Ont.—The City Council have passed by-laws for the expenditure of $85,300 for a trunk sewer, $25,000 for gas extensions, $35,000 for electric extensions, and the rest for local improvements.

Victoria, B.C.—With the completion next month of a dam being built by the British Columbia Electric Co. at Jordan River, in connection with an increase of power development at its plant, 14,000 h.p. will be developed.

Winnipeg, Man.—The terminal power station on Rover Street is to be enlarged; contractors, the Fort Garry Construction Co., Winnipeg. The price is $35,800. New equipment will consist of transformers and switching apparatus.

Medicine Hat, Alta.—It is proposed to electrify the spur, six miles long, running to Ainsley Mine and serving several industrial sites, and arrange with the street railway company to operate motors thereon to do switching for industries.

Toronto, Ont.—The Hydro-Electric Commission will build a transmission line to Morrisburg and Eastern Ontario, 40 miles long, with branches. It will carry 22,000 volts. Power may be obtained from an American company on the St. Lawrence river.

Peterborough, Ont. — The Canadian General Electric Co. will erect two new factory buildings here, costing $7,000 each. There will be one one-story building, 52x127 ft., and one two-story structure, 68x200 ft. The construction will be of brick, concrete foundation.

Toronto, Ont.—Engineer H. H. Couzens of the Toronto Hydro-Electric system is advocating the construction of a steam reserve plant in order to insure an uninterrupted power service to manufacturers in the event of another breakdown in the Hydro transmission system.

If his recommendation is adopted a contemplated cut in rates cannot be made.

Vancouver, B.C.—The Pacific Great Eastern Railway Co., contemplates electrifying their line; and the Bridge River Co., recently incorporated, will develop 200,000 h.p. in the Lliollette district at a cost of $8,000,000, to supply the power. A dam will be built on the Bridge River, and a tunnel, 1¾ miles long, driven through the mountain.

Toronto, Ont.—The Toronto Electric Light Co. have been awarded a permit to build a $12,000 sub-station on the Esplanade in which they will use turbo equipment. R. J. Fleming says nothing about their plans, but it is believed this is a steam reserve for the system, and that expensive equipment will be purchased.

Water Works

Hamilton, Ont.—Owing to the poor showing of the steam pumps during the recent breakdown in the Hydro-Electric system, it is probable the city will call for tenders for new pumps before long.

Hespeler, Ont.—The village Council may erect waterworks with three miles of mains. Clerk, Winfield Brewster.

Orillia, Ont.—The ratepayers have voted against spending $58,000 on extensions to the waterworks system.

Winnipeg, Man. — Excavating machines will be used largely in the construction of the waterworks plant and conduit which will be built to supply the city with water from Shoal Lake.

Sault Ste. Marie, Ont.—The city will have to arrange soon for a civic water supply. It will probably take over the Tagona Water and Light Co. plant and operate it. The lighting system may also be taken over by the city.

Calgary, Alta.—A. W. Ellson Fawkes, waterworks engineer, invites proposals for a 2 ft. 4 in. railway, 2 dinkie engines and 12 cars, for carrying mains along route to source of water supply, 45 miles away.

Wood-Working

Stratford, Ont.—The city is building a $3,000 addition to the waterworks. Chairman, C. E. McIlhargey.

Westville, N.S.—Cameron & Fraser Ltd., are building a boiler house in connection with their new planing mill.

Wingham, Ont.—The John A. Mc Lean sawmills were destroyed by fire on June 25. The plant will be re-built on a larger scale.

Oshawa, Ont.—The water commission are contemplating the installation of electric pumps at the lake in place of the steam pumps, at a cost of $3,000.

Thorold, Ont.—Adams, Farrell and Hardlip, of the Tonawanda Board Co., Tonawanda, N.Y., were here recently looking for a site for a Canadian branch plant.

Municipal

Virden, Man.—The town has voted $25,000 for highway improvement.

Quebec, Que.—The C.P.R. will spend $2,000,000 for the new St. Louis Street wing of the Chateau Frontenac Hotel.

Merritt, B.C.—The town council will purchase a 125 k.w. unit, 3-phase, 60. cycles, 2,300 volts this year, for a power plant addition.

South Vancouver, B.C.—Peter Wylie has been appointed to succeed W. H. Baxter as street superintendent of engineering department, South Vancouver, B.C., at a salary of $225 a month.

Building Notes

East Calgary, Alta.—A building permit for the construction of the P. Burns & Co., packers, plant has been issued. The cost of the buildings will be $200,000. L. R. Burns is in charge of the work.

Toronto, Ont.—Plans are being prepared at Ottawa by the Dominion Government for new Government buildings and Union Passenger Stations. For this, both Front and Yonge Streets will be widened to provide ample approach.

Victoria, B.C.—Plans have been completed for a theatre to be erected here at a cost of about $125,000. The building is to be of steel, brick and concrete, 60 x 120 feet in size. J. J. Donnellen, 319, Pender St. W., Vancouver, B. C., is the architect.

General Industrial

Port Arthur, Ont.—Messrs. Davidson and Smith will build a larger flour mill here than was at first intended.

The London Cold Storage and Warehousing Co., Ltd., has increased its capital stock from $75,000 to $150,000.

Ottawa, Ont.—Fire, June 16, destroyed the main building of the Ohio Brick & Tile Works. Loss, $5,000.

The Thunder Bay Contracting Co., Ltd., Port Arthur Ont., has increased its capital stock from $50,000 to $250,000.

Sherbrooke, Que.—The council has voted in favor of granting aid to the Crown Mfg. Co., of Rock Island, who will build their plant here.

Quebec, Que.—Fire destroyed the Canadian Packing Co.'s plant at Limoilou, June 24th, the loss of $25,000 being covered by insurance.

Lake Megantic, Que.—Joseph Asselin of Beauce Junction, Que. will erect the necessary buildings for a knitting factory here. The Cliche Broom Co. will also build a plant.

Calgary, Alta.—Belley Brothers, Ltd., has been incorporated with a capital stock of $150,000 by Louise de Gonzague Belley, Alfred Belley and others, to build flour mills.

Ottawa, Ont.—Worw will probably be started next month on the harbor improvements and building of grain elevators at Port Nelson, which is to be the terminus of the Hudson Bay Railway. About $5,000,000 will be expended for these improvements. Hon. Frank Cochrane, Minister of Railways and Canals, Ottawa.

Rossland, B.C.—The shaft and tank houses owned by the War Eagle Mine Co. were recently damaged by fire to the extent of $50,000. The structures will be rebuilt.

Edmonton, Alta.—The Staince Co., manufacturers of iron beds, springs, mattresses etc., will build a warehouse and factory, four storeys high. A. G. Wildren, manager.

Vancouver, B.C.—The Alaska Bedding Co. of Winnipeg will shortly establish a branch factory here at a cost of $150,000, employing 100 hands. J. H. Barkhill, Winnipeg, Pres.

MACHINE TOOL EQUIPMENT WANTED.

The School Commissioners of Edmonton, Alta., are in the market for the under-noted machine tool equipment for a new Manual Training School:—

Two milling machines,
One planer,
One cutter grinder,
One universal grinder,
Two wet tool grinders,
One high speed drill,
One radial drill,
One boring mill,
Two speed lathes,
One high speed saw
Two high speed lathes,
Ten 14-inch lathes,
Two shapers.

In addition to the foregoing, a complete foundry outfit, a complete equipment for a woodworking shop, and a complete forge shop installation will be required.

Sir Rodolphe Forget was in Toronto on Thursday last with Mr. Greenshields. They visited the new plant of the International Brick Co., at Cooksville, of which Company the latter is president.

Edmonton, Alta.—The Canadian Oil Co., Ltd., Calgary, has lost its contract for the 1913 supply of oil to the power plant because their samples did not come up to specifications.

St. Catharines, Ont.—The Canadian Flax Mills, Ltd., Toronto, capitalized at $1,000,000, will build a plant here, costing $150,000, employing 150 hands, if given a site and fixed assessment.

Vernon, B.C.—A local company composed of Messrs. Mutrie and Mutrie, Neil and Cryderman, H. G. Muller, Billings and Cochrane, C. O'Keefe, E. F. Lloyd, and R. Swift has just bought the patent rights for the manufacture of pressed cement bricks, invented by D. F. Shope, of Portland, Oregon. They may enlarge the present Vernon plant.

Toronto, Ont.—The Consumers' Gas Co. realized $570,000 at a sale of stock on Thursday last. Arthur Hewitt, general manager, says this will be used for further development.

Brampton, Ont.—The ratepayers have voted in favor of lending $20,000 and $15,000 to the Hewetson Shoe Co. and the Hough Lithographic Co. respectively, who will erect factories in Brampton.

Port Renfrew, B.C.—The British Canadian Lumber Corporation, Ltd., has asked shareholders to authorize a bond issue of $3,500,000 to provide for the erection of a mill at Port Renfrew, and for other purposes.

Moose Jaw, Sask.—The Saskatchewan Clay Deposits Co., Ltd., have started manufacturing fire and pressed brick, and may later build a plant for manufacturing a rougher brick and sewer and water pipes.

Moose Jaw, Sask.—The Saskatchewan and Western and the Southern Elevator Companies are adding to the capacity of their buildings here, and it is thought the Imperial Co. will do likewise.

Edmonton, Alta.—Plans are now being prepared by the Fitzhugh Lime & Stone Company for the installation of additional machinery to its plant, which will have the effect of increasing its output of lime from the present daily capacity of 10,000 barrels to 50,000.

Toronto, Ont.—The Government is establishing a brick-making plant at Mimico, being a branch of the Central Prison movement. Hon. W. H. Hanna, Provincial Secretary. The plant will have a capacity of 10,000,000 bricks a year, and will supply bricks for government buildings.

Railways - Bridges

Ottawa, Ont.—Hon. Frank Cochrane has decided to double-truck the Intercolonial Railway line from Moncton to Halifax, N.S.

Toronto, Ont.—The Dominion Government will build a viaduct of concrete and steel, along the water front, and will spend $6,000,000 or $7,000,000 as its share of the expense.

Vancouver, B.C.—Sir Richard McBride announces that the Pacific great Eastern Railway will extend into Alaska through from Vancouver. Present plans of the line carry it north only as far as Fort George, 450 miles from Vancouver.

Cobalt, Ont.—Chairman Englehart, of the T. and N. O. Railway, says a suitable route for extending the Elk Lake branch beyond Gowganda cannot be found.

Morrisburg, Ont.—The Williamsburg township has voted against granting right-of-way and a bonus of $8,000 to the Ottawa and St. Lawrence Electric Railway Co.

Ottawa, Ont.—Three bridges are to be erected on the Canada Eastern branch of the Intercolonial Railway, this summer across the Nashwaak River above Marysville, at Covered Bridge, and at Nelson Hollow.

Stratford, Ont.—A municipally-owned street railway system with hydro-electric power, is being contemplated by the Council. The franchise of the Stratford Street Railway Co., which was to have been financed by the C. N. R. interests, will probably be cancelled.

Victoria, B.C.—The Esquimault and Nanaimo Railway is spending $100,000 on machine shops, round houses and terminals at Russell station. The round house, which has ten stalls, is nearly complete. The machine shop will measure 145 by 72 ft. E. R. Doe has the building contract, and R. A. Bainbridge is the divisional engineer.

Contracts Awarded

Sydney, N.S.—The C. N. R. has just placed a large order for rails with the Dominion Steel Corporation.

Hamilton, Ont.—Richard Pope has the contract for erecting a theatre costing $20,000 for E. J. Guest.

Yorkton, Sask.—Ritchie & Watters have been awarded the contract for the erection of the power station. The contract price is $36,557.

Ottawa, Ont.—The Government has awarded the contract for the new Customs House on Sussex Street to the Simcoe Construction Co., of Simcoe, for $995,000.

St. John, N.B.—The Provincial Government has awarded the firm of James McVey & Son, St. Stephen, the contract for the substructure of a bridge at Reversing Falls.

Moose Jaw, Sask.—The city has awarded the firm of Willans & Robertson the contract for the installation of a new 1,500 k.w. turbo generator for the power house.

South Vancouver, B.C.—The British Columbia Equipment Co. has been awarded a contract for the construction of a 750,000 gallon steel standpipe at $30,000 by the City Council.

Montreal, Que.—The Board of Control has granted a contract for widening the city aqueduct to the Cook Construction Co., of Sudbury, Ont., the lowest tenderer. Their price is $2,322,552.

Regina, Sask.—Parsons Construction and Engineering Co. are erecting an incinerator building for the city, and the Decarie Incinerator Co., Minneapolis, Minn., will supply the incinerator plant.

Ottawa, Ont.—A contract has been awarded to the Peter Lyall Construction Co., of Montreal, for improvements to Rideau Hall. The figure is $125,000, and the main work consists of a new entrance.

Fredericton, B.C. — The Concrete Construction Co., Ltd., of Ottawa, has been awarded a contract for painting the steel bridges in New Brunswick by the Provincial Department of Public Works at a cost of $25,000.

Edmonton, Alta.—The city has awarded the contract for building the filtration plant to the New York Continental Jewell Co. for $117,000, to be completed April 15, 1914. The contract for sewage pumps went to W. H. Allen, Son & Co., Bedford, England, for $1,960.

Strassburg, Sask.—The British Canadian Engineering Supply Co., of Winnipeg, has been awarded the contract for supplying the town with one 50 h.p. Ruston-Proctor gas producer and engine, and the Canadian General Electric Co., the contract for 37½ k.v.a. generator, exciter, etc.

Newcastle, N.B.—Hon. John Morrissy, Provincial Minister of Public Works, has awarded the contract for the steel superstructure of the new bridge at Newcastle to the Dominion Bridge Co., of Montreal, the contract price being about $100,000. The contract for the Clain bridge in King's County was awarded to A. E. Smye, of Alma, Albert County, his tender being in the vicinity of $2,500.

Tenders

Ottawa, Ont.—Tenders were called last week for the Toronto Harbor works, to cost $6,000,000. Plans are in view, for similar works at Hamilton.

Toronto, Ont.—Tenders will be received by the Board of Control up to July 8th for a pumping station at the foot of Woodbine Avenue. H. C. Hocken, Mayor.

New Westminster, B.C.—The School Board will call tenders for a commercial school, chemical laboratory, and for heating systems.

On July 17 the tenders for the first section of the Welland Canal will be in, and those for other sections will be called in a month or so.

South Edmonton, Alta.—Tenders have been called for the erection of the new C. N. R. station of brick and stone, which, together with the iron covered shed, will cost $40,000.

Victoria, B.C.—The Engineering staff of the Public Works department is working on the plans for piers and harbor work at Victoria, B.C. The plans will be ready this month and tenders will be called.

Ottawa, Ont.—Tenders, addressed to J. K. Jones, Asst. Deputy Minister of Railways and Canals, Ottawa, and marked "Tender for Steel Pontoon Gate Lifter, Trent Canal," will be received until 16 o'clock on Tuesday, July 29th, 1913. Plans, specifications and form of contract to be entered into can be seen on or after this date at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Superintending Engineer, Trent Canal, Peterborough, Ont.

Refrigeration

Vancouver, B.C.—The Mainland Ice & Cold Storage Co. is having plans prepared for a new cold storage plant, four storeys, of mill construction. Estimated cost, $150,000. Gould & Wood, Vancouver, B.C., architects.

Marine

The Canadian Towing and Wrecking Co., Ltd., has increased its capital stock from $100,000 to $200,000.

Hamilton, Ont.—The Ottawa Contractors, Ltd., have begun work on the extension of the revetment wall. Work will not be completed until a year next autumn.

Victoria, B.C.—The Government will establish a ferry service between Woodwards Landing and Ladner, and will make an early start on road improvement.

Quebec, Que.—In a few days the government will award contracts for the largest dry dock in America at St. Joseph de Levis, and for deepening the St. Charles River.

Walkerville, Ont.—A new steel passenger ferry boat Essex was launched at the Toledo Shipbuilding Co's. plant June 25, for the Detroit & Walkerville Ferry Co. It will be delivered Aug 1. and will cost $100,000 and will carry 600 people.

Selkirk, Man.—The Selkirk, a passenger steamer for the Lievre River Navigation Co., was launched on Wednesday, June 18, at the Landing. It will cost $9,000, and is being built by R. J. Morril, Collingwood, the Doty Marine Engine and Boiler Co., Ltd., supplying the boiler and engine.

New Incorporations

Kipawa Power Co., Ltd., incorporated at Ottawa, capital $1,000,000, to generate electricity at Toronto.

Radio Electric Co., of Canada, Ltd., incorporated at Ottawa, capital $200,000, to manufacture telephones and telegraph apparatus at Montreal.

Transcontinental Power Corporation, Ltd., incorporated at Ottawa, capital $10,000, to distribute electrical energy or any other power or force in Toronto.

London Asbestos and Supply Co., Ltd,. incorporated at Toronto, capital $25,000, to buy and sell asbestos at London. Incorporators: John Putherbough, Thos. L. Partridge, etc., London.

Resilent Spring Wheel Co., Ltd., incorporated at Toronto, capital, $40,000; offices at Toronto. Incorporators: Geo. H. Sedgewick, Austin G. Ross, etc., Toronto.

Amalgamated Nickel-Copper Mining Co., Ltd., incorporated at Toronto, capital $1,000,000, to acquire mineral lands and deposits at Ottawa. Incorporators: William C. Perkins, Harold F. Meech, etc., Ottawa.

Armstrong Cork Co.—Notice of the incorporation of the Armstrong Cork Co., Ltd., appears in The Canada Gazette. The company is capitalize dat $100,000, with headquarters at Toronto. Among the incorporators are W. A. J. Case, solicitor, James B. Taylor and George C. Loveys, accountants, all of Toronto.

Trade Gossip

The Erindale Power Co.and The Interurban Electric Co. are at law over $93,000 which the former claims from the latter for power alleged to have been supplied.

The Truro Foundry and Machine Co., Ltd., Truro, N.S., has been placed in the hands of a receiver. It is believed the plant will be taken over by a new company, shortly to be formed.

Convention of Boiler Manufacturers.—The twenty-fifth annual convention of the American Boiler Manufacturers' Association of the United States and Canada will be held in Cleveland, Ohio, on September 2, 3, 4, and 5, 1913.

The International Harvester Co., Hamilton, Ont., announces that it will close its plant this summer for not less than a month. It usually closes down for two weeks for stock-taking. The demand from the West has not been as large as usual.

The American Club, 19 Wellington Street W., Toronto, which was recently formed, has bought the Union Bank Building at the above address. Most of the machinery men of Toronto who are Americans, or who have lived in the United States over four and a half years, are members.

Goulds Pump Co., of Canada.—The business of the Goulds Pump Co., of Canada, Ltd., is now being carried on under the name of the Storey Pump and Equipment Co., Ltd. The present offices at Montreal and Toronto, and the personnel of the Company have not undergone any change.

Canada's U.S. Trade.—During April, 1913, the exports of Canada to the United States amounted in value to $8,763,013, which is $497,334 less than those of April, 1912. Her imports from the United States for the month were $37,416,217, exceeding the corresponding figures of last year by $6,416,998.

The Canadian Abrasive Wheels Co., Ltd., who have purchased a site in Dundas, Ont., for a plant, costing a minimum of $20,000, is reported to be the new name for the Canadian Corundum and Wheel Co., Barton Street, Hamilton, who have been contemplating an extension for some time, but found it inconvenient to do so in Hamilton.

Oppose tax on machinery—Under the revised municipal code of the Province of Quebec, the taxing of machinery is permissible. The Boards of Trades in session at Farnham, Que. passed a resolution last week expressing belief that such a tax would be detrimental to the manufacturing interests of the Province. It was recommended that this Article be struck out of the municipal code.

John Bertram & Sons, Co., Ltd., Dundas, Ont., have increased their equipment by the addition of an 84-inch Pond reversing motor planer, a 96-inch motor-driven boring mill, and two Cincinnati milling machines. The plant has been equipped with twenty-six motors, made necessary by the change from 66 to 25 cycle current. Last week a Colliau cupola, manufactured by Byram & Co., Detroit, 48 in. diameter, was substituted for 36-inch cupola.

The Perolin Co. of Canada, Ltd., was recently incorporated in this country as sole distributors in Canada of Perolin, a mechanical treatment for boiler scale, pitting and corrosion. It has been used in Europe for eighteen years under the name of S. R. Sampf-Keffel-Meschung, and Old Country engineers in Canada will remember it by that name. When injected into the boiler Perolin forces its way through the cracks in the scale and breaks it down; the Perolin remains and prevents further encrustation. Headquarters are in the Standard Bank Building, Toronto, and some well known Toronto business men are on the directorate.

The International Engineering Works, Ltd., Amherst, N.S., have recently sold return tubular boilers to the following companies:—C. W. Church, Falmouth, N.S., 50 h.p.; Amherst Pianos, Ltd., Amherst, N.S., 110 h.p.; R. H. Williams, Regina, Sask., three 110 h.p.; Grant Bros., Calgary, Alta., 65 h.p. Robb portable boilers have also been recently sold to A. C. Higgs, Nappan, N.S.; C. O. Black, Oxford, N.S., and McGillivray Creek Coal & Coke Co., Calgary, Alta. The Canadian Westinghouse Co., Hamilton, Ont., have recently purchased three engines from the International Engineering Works, Ltd., for direct-connection to alternating current generators for the Canadian Pacific Railway, and the Canadian Explosives, Ltd., Montreal, Que., are to install two 14 in. by 18 in. Robb Corliss engines direct-connected to 125 K.V.A. electric generators.

The Chapman Engine and Mfg. Co., Dundas, Ont., have begun the manufacture of small size gasoline engines and well drilling machinery. Operations were commenced two years ago in a disused cotton factory, which has been converted into an up-to-date engineering plant, with first-class machine tool and other equipment. Up till last summer they purchased the castings for their engines outside, but have now a foundry with a 56 inch Calumet cupola, made in Harvey, Ill. Moulding is done both on bench and floor, and eventually moulding machines will be employed. Besides the machine shop and foundry, there is a pattern shop, core room, with the latest core oven, cleaner room, forge, testing, assembling and painting department. Ample room is allowed for expansion, which should take place before long, as developments are being planned. About a hundred men are employed. Steam is supplied by a boiler made by Goldie & McCulloch, Galt, Ont.

Personal

J. M. Reid, who has purchased the Beaverton foundry, was formerly with the Paxton Tate Co., Port Perry.

George Butcher, superintendent of Darling Bros., Ltd., Ottawa Street, Montreal, has gone on a brief holiday.

John Ankers has been appointed by the New Westminster, B.C., City Council to the position of waterworks superintendent. He was for twenty years pipe line inspector for the city.

V. I. Smart, of the department of railway engineering, McGill University, Montreal, has resigned to accept the position of general manager of the General Railway Signal Co. of Canada.

J. G. Seyfried, structional engineer, Grand Trunk Railway, Montreal, has been appointed engineer of the bridge department, Canada Foundry Co. Ltd. Mr. Seyfried will have his headquarters at the Toronto plant.

District Engineer McLachlin, who is located at Victoria, B. C. will be put in charge of the work of surveying Esquimalt Harbor by the Dominion Department of Public Works, with a view to location of the new $3,000,000 dry dock.

Gasoline Engines.—We have received from Canadian Engines, Ltd., Dunnville, Ont., a copy of their 1913 catalog decriptive of their "Monarch" line of Gasoline Engines. These are made in small sizes, and are well adapted for use around the farm, also for driving pumps and generators. The catalog is well illustrated and the reading matter very instructive.

Prof. Howe, of the Chair of Engineering, Dalhousie University, has been appointed engineer for the Grain Commission in charge of the construction of all terminal elevators to be erected in the West. Mr. Howe is a native of Waltham, Mass., and a graduate of Massachusetts Institute of Technology, and has been Professor of Engineering at Dalhousie for five years.

Collingwood B. Brown has been appointed to the position of Chief Engineer of the Government railways in Canada. Since graduation in civil engineering in Cornell fourteen years ago, Mr. Brown has been in the employ of the C.P.R., filling various engineering positions from rodman to principal assistant engineer, a post to which he was appointed two years ago, and which he now resigns to become head of the Government railway's engineering department. He will take up his residence at Moncton on the 1st of July.

Peter Donaldson, Glasgow, Scotland, 54 years of age, a bachelor, and chief partner in the firm of James Watson & Co., who recently failed, was found drowned in the Clyde, according to a cablegram from London June 24. He was also president and managing director of the Dayton Coal & Iron Co. operating two blast furnaces at Dayton, Tenn. The liabilities of his company are stated to be about $1,995,000, while the assets may not amount to more than $650,000. The tragedy and disaster are the result of efforts to corner the pig iron market, the Watson Co., having attempted to carry a bigger load than they were able.

D. A. Street, Ottawa, was elected president of the Canadian Electrical Association for the coming year at their annual convention at Toronto on Friday, June 27. The following other officers were elected:—first vice-president, A. L. Mudge, Toronto; second vice-president, B. H. McDougall, Toronto; third vice-president, W. Maclachlan, Trenton; honorary secretary, T. S. Young, Toronto; secretary-treasurer, H. T. Martin, Toronto; managing committee, A. A. Dion, Ottawa; J. S. Goulds, Smiths Falls; F. G. Clarke, Toronto; L. Clark, Hamilton; R. S. McDunnough, Three Rivers; H. G. Matthews, Quebec; E. L. Milliken, Sydney; W. L. Bird, Fort William; W. S. Robertson, Toronto; A. G. Dunlop, Peterboro'; R. M. Wilson, Montreal; R. H. Sperling, Vancouver; R. J. Smith, Perth; W. G. Angus, Hamilton.

Obituary

John Hall, for 40 years a patternmaker in the employ of The Burrow, Stewart & Milne Co., stove makers, Hamilton, Ont. died on Tuesday, June 24.

John W. Ritchie, formerly of Orillia, Ont., chief operator of the Mississippi River Power Distributing Co., St. Louis, Mo., was electrocuted on June 28th, at the company's plant.

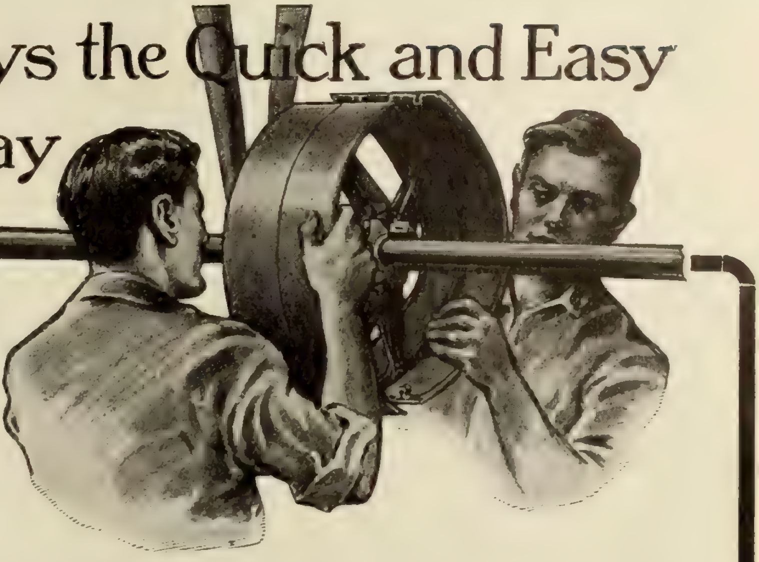
Install Your Pulleys the Quick and Easy "AMERICAN" Way



HOW much time and money do you lose every time you install a new pulley or change a pulley from one shaft to another? Figure it out. Most engineers and mill men, who take the trouble to make this calculation, adopt the

"American" Steel Split Pulley

Perfect in Principle Powerful in Performance

A mechanic and helper, with a wrench, can install an "American" pulley during the lunch hour on any size shaft. No stripping, no need of key-way or set screw—just tighten a few bolts, and be sure you tighten them evenly.

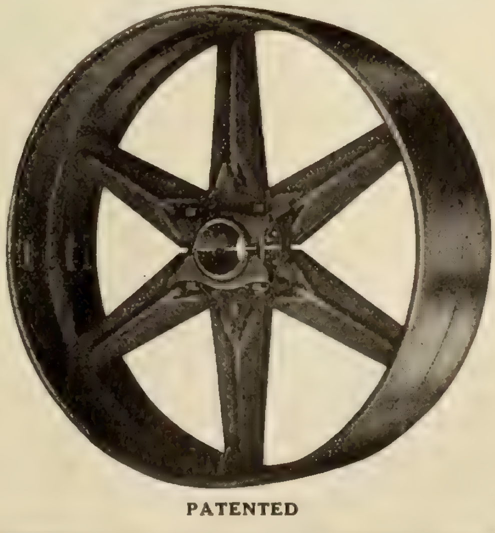
When the one o'clock whistle blows, you have a pulley much safer than any other type, which will perform double belt service under any conditions not requiring a special pulley.

Some "American" Superiorities

Forty-five per cent. lighter than cast iron pulleys; stronger than any other steel pulley; with grooved air escape on face, improving belt contact.

"A"-braced arms give perfect rigidity, while offering least air resistance.

"Americans" are particularly well balanced and are, by far, the truest steel pulleys made—truer than some turned pulleys.



PATENTED

The American Pulley Company

Vapor.'' Copies may be had on application to the Engineering experiment station of the University at Urbana, Ill.

The Greenfield Machine Co., Greenfield, Mass., favor us with a bulletin dealing with their universal grinder. It will sharpen straight, taper, or rose reamers; spur, bevel, spiral, formed or end milling cutters; taps, countersinks, or counterbores. Their complete catalogue will be sent for the asking.

The Slack Mfg. Company, Sprinfield, Vt., describe several examples of the cutting qualities of their abrasive metal cutter, in a folder just off the press. It will cut through high-speed steel ½ in. square, in 6 seconds, and through half-inch steel tubing in 2 seconds.

Simplex Seatless Valves.—The Simplex Seatless Valve is described clearly in a pamphlet which we have received from the Garlock Packing Co., Hamilton . A copy of this pamphlet, which is entitled ''The Solution of the Worst Boiler Room Problem,'' will be gladly mailed to interested readers.

''Wooster'' Belting.—We have received a booklet describing the ''Wooster'' Belting, which is handled in Ontario by Wm. and J. G. Greey, Toronto. ''Wooster'' is a solid woven cotton, and not a ''ply'' or ''sectional'' belting. It is made in three standard thicknesses, and is made to withstand severe climatic conditions. The booklet will be gladly sent to interested readers .

Coates Clipper Mfg. Co., Worcester, Mass., have sent us a copy of their Bulletin No. 24, which illustrates and describes the different classes of work where ''Flexishaft'' can be used. The various equipments that can be used with ''Flexishaft'' are also illustrated, and show the wide range possessed by this flexible shafting. The reading matter and illustrations are clear and concise. Copies of the Bulletin will be mailed on request .

126 Adelaide St. E., Toronto

Keep in mind the dominant fact that mankind from its first appearance on the earth has been schooled by nature to look for signs; for invitations to taste; for suggestions as to what to wear. Tell your story briefly, forcibly, truthfully, and address it through the proper media and you can successfully apply advertising as a means to increased distribution.

Ideas at Two Cents Each

¶ An idea that's worth anything at all to a Mechanical man is worth more than two cents.

¶ It might be worth hundreds of dollars.

¶ Every issue of "CANADIAN MACHINERY" is full of practical, helpful ideas. You ought to be able to sift out four each month that would prove of some use to you. Put a value of two cents on each and your subscription has been paid.

¶ You cannot afford to miss even one issue—you might miss the idea that would be worth hundreds of dollars.

¶ The date on the label of your "CANADIAN MACHINERY" wrapper shows when your subscription expires. One dollar will renew it for a year.

Don't put off Renewing—Do it to-day

Classified Advertisements

¶ Those who wish to sell or buy a business, obtain competent help, connect with satisfactory positions, or secure aid in starting new enterprises should not fail to use the Want Ad. Page of "CANADIAN MACHINERY."

¶ If you want to sell or buy a second-hand lathe, planer or any other shop equipment, let "CANADIAN MACHINERY" pick out a seller or buyer for you. How about that second-hand engine or boiler which you would like to dispose of?

¶ "CANADIAN MACHINERY" is the central market place of the machinery trades throughout Canada.

¶ There is always some one looking for just such proposition as you have to offer.

thing for Blue Printing," which is a description of the "Peerless" blue printing machine. The complete process of making blue prints is embodied in the Peerless Machine, as it automatically prints, washes, and dries at one operation. The machine is fully described as is also all other equipment made by this firm. The catalogue is comprehensive, and a copy will be gladly sent on request.

Gooley & Edlund, Syracuse, N.Y., have issued a Bulletin devoted exclusively to the Briggs high duty milling machine, which is a radical departure from the conventional milling machine. It has a solid arch frame, with the direct-geared drive close to the end of the arbor. The table has a screw feed, with a quick return. The machine was designed principally for form and gang milling of steel parts for guns, automobiles, typewriters, sewing machines, etc. The designer had felt the need of a machine adapted to heavy and rapid cuts.

Mechanical Stokers.—We have received from E. Bennis & Co., Ltd., Bolton, Eng., a copy of their latest pamphlet entitled "Cheap Steam and Machine Firing," which contains a description of the "Bennis" Stoker and other "Bennis" specialties. A concise description with illustrations is given of the construction and operation of their Standard Stoker. Illustrations are given of the stoker arranged for gas firing as an alternative to coal firing, also as adapted to leading types of boilers. Some interesting figures are given, taken from tests of the stokers with compressed air furnaces. The pamphlet has a very attractive cover, suggestive of the glowing fire and bright flame of the boiler room. Copies will be gladly sent to bona-fide users upon application to the Canadian Representative, Geo. H. Tod, Manning Chambers, Toronto, Ont.

Baker Bros., Toledo, Ohio, have sent us a set of catalogues and leaflets covering the line of machine tools which they manufacture. This includes Boring and Tapping Machines, High Speed Automatic Drills, etc. One of their principal lines is the "Colburn" Keyseater and Slotter which is made in 6 sizes. This machine has a wide range and various attachments can be furnished for different classes of work. Another feature is the automatic drill recently put on the market. Certain operations are performed automatically and it is claimed that there is a considerable saving of time. The catalogues are exceedingly well got up, the reading matter being comprehensive and illustrations clear. Copies will be gladly sent to any readers interested in this class of equipment.

Works Administration.—An interesting booklet entitled "Works Administration," has been received from the publishers, Gunn, Richards & Co., of Montreal and New York. This firm are production engineers and public accountants, and so are able to write on such topics from a first-hand knowledge of the subject. The booklet explains the meaning of Production Engineering, and points out what the duties of production engineer consist of. It is also a plea to manufacturers to consider the question of plant organization on systematic lines as a means of effecting economies, and increasing all-round efficieny. Gunn, Richards & Co. will be pleased to hear from any reader interested in this subject.

"Wherever you go the world over, a package of Cling-Surface sits beside the belts." This claim is made by the Cling-Surface Co., Buffalo, N.Y., and is the apt title of a 24-page booklet describing and illustrating installations of Cling-Surface treated belts in Germany, England, Scotland, Ireland, Norway, Sweden, France, Spain, Switzerland, Belgium and many more foreign countries. It is a convincing and valuable little booklet that every user of belts should have. A copy will be sent free on request.

Miscellaneous

Port Coquitlam, B.C.—The fire chief will recommend that the city purchase a motor truck and hose for adequate fire protection.

Hamilton, Ont.—The lining of a furnace at the plant of the Steel Co. of Canada, blew out on Sunday, June 29th. Damage between $20,000 and $40,000 being done.

Vancouver, B.C.—J. B. Graves, of Granby Mines and Smelter, Grand Forks, B.C., says a refinery will be erected at Vancouver to supply the Chinese markets with copper and silver.

Montreal, Que.—The electric car service over the Montreal & Southern Counties railway tracks between Chambley and Richelieu was inaugurated last week.

* * *

Oil for Diesel Engines.—Generally speaking, the oil for use in a semi-Diesel engine needs to be slightly lighter than in a Diesel engine," says The Times Engineering Supplement. Care must be exercised in judging the claims of a particular engine to run on a specially heavy oil, as such claims are very often based on the fact that the engine has run satisfactorily in that particular oil when used intermittently with another and lighter oil. The performance, therefore, of engines of the Diesel and semi-Diesel type in regard to fuel should only be judged by their performance on long runs, the use of an oil above 0-9 specific gravity generally necessitating very frequent cleaning. which nullifies the advantages gained by the employment of a cheaper grade of fuel.

* * *

INFORMATION FOR INVENTORS.

PIGEON, Pigeon, & Davis, Patent Solicitors, 71A St. James Street, Montreal, report that 211 Canadian Patents were issued for the week ending June 10th, 1913, of which 127 were granted to Americans, 47 to Canadians, 25 to residents of Foreign countries, and 12 to residents of Great Britain and Colonies.

Of the Canadians, who received Patents, 19 were residents of Ontario, 10 of Quebec, 7 of Manitoba, 5 of British Columbia, 3 of Saskatchewan, 2 of Alberta and 1 of New Brunswick.

In the United States for the same week, 752 Patents were issued, 12 of which were granted to Canadian inventors.

The First Sign of Decay

¶ A salesman who was more than a salesman was trying to sell his line to a certain manufacturer.

¶ "No," argued the latter, "I do not care to change. I am satisfied with the line I am now using."

¶ "That," replied the salesman, "is the first sign of decay!"

¶ It was a jolt for the manufacturer. It bumped him clean out of the rut of self-satisfaction, and set him thinking.

¶ It cranked the engine of progress that had stilled within him and set to work the rusty machinery of his ambition.

¶ The salesman secured his order and later received a letter profuse with thanks.

¶ Any man who is satisfied with his business as it is has entered upon a period of commercial decay.

¶ No matter how successful a business may be there is a legitimate twentieth century way of making it better.

¶ There is a vital force that can be injected into it—a regenerating force that will eradicate decay and replace it with the pulsing throb of increasing profits.

¶ That force is ADVERTISING. And advertising is never so forceful and effective as when it is undertaken in highly specialized mediums, of which this journal is so fine a type.

You can have your patterns made here, and castings machined.

NEAREST STEEL FOUNDRY to the MARITIME PROVINCES

Careful attention and prompt delivery.

F·X·DROLET QUEBEC P.Q.

MACHINIST & FOUNDER

FUEL COST

Does Not Determine the HEATING COST

One is at the start and the other at the finish of the operation. The extent of the difference is determined by the furnace, fuel and operation employed for the purpose.

We design and build furnaces for:

CASE HARDENING
FORGING
ANNEALING
ETC.
HEAT-TREATING
MELTING
TEMPERING

Write for catalog 46.

W. S. ROCKWELL COMPANY

Furnace Engineers and Contractors

50 Church St. NEW YORK

(Hudson Terminal Building)

CUT GEARS

When you want a gear cut you want it quickly. We emphasize our promptness without sacrificing accuracy.

SPRING WINDING MACHINES

for wire up to 3-16 in. diameter. For springs of any length or diameter, either open or closed. A small machine but a big time and money saver.

Hand Power BENDING TOOLS

for blacksmiths, machinists and concrete workers. For making angles, eye-bolts and concrete reinforcements.

A. E. WHITEHOUSE, 76 St. George St., Montreal

SHAFTING

Cold Drawn, Turned and Polished Steel, Rounds, Squares, Hexagons and Flats, Steel Piston Rods, Pump Rods.

Special facilities for Keyseating up to 6′ diameter.

THE

Canadian Drawn Steel Co.

Limited

Hamilton Canada

COMPLETE INSTALLATIONS

of Factories for the manufacture of

Bricks, **Tiles,** **Pipes, of all kinds,** **Slabs, for walls and floors.**	Made of **Clay** and of **Cement**	**Fire Bricks,** **Dinas Bricks,** **Lime Sand Bricks,** **Asbestoscement Slate.**

Experience of many years. **Testing shop in my own factory.** Examination of raw materials and expert advice thereon.

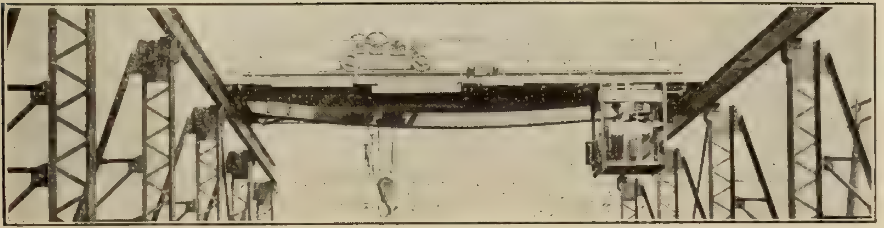
20-30 Cooper Ave. TORONTO

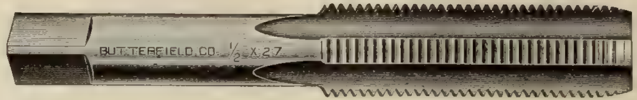


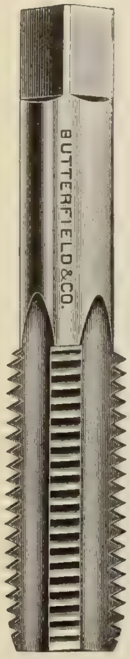
CRANES

All kinds and sizes for all purposes. Detailed specifications and prices upon request.

John T. Hepburn, Crane Builder, Iron Founder and Machinist
18-40 Van Horne St., Toronto, Can.

"BUTTERFIELD"





BUTTERFIELD & CO.

The Name that Assures the

Highest Quality, Taps, Dies, Reamers and Screw Plates

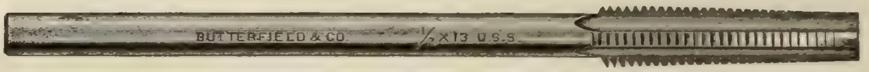
Made from carefully selected material and by skilled workmen who have spent years in our service endeavoring to produce the finest tools on the market. Their efforts have resulted in a perfect line of tools that need fear no comparison.

The high quality is also largely due to our special hardening and tempering process that has given our tools a wider field of usefulness and a longer lease of life. A trial order will prove our claim.

Write for details and prices.

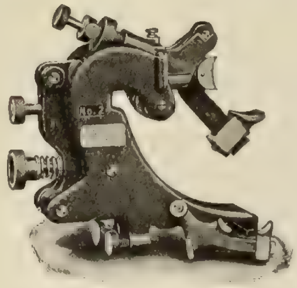
BUTTERFIELD & CO.

ROCK ISLAND, QUE. **DERBY LINE, VT.**



BUTTERFIELD & CO. ½ X 13 U.S.S.

Support the Complicated Pieces Correctly with B. & S. Universal Back Rests



These rests provide a firm support for work. Resist tendency of pieces to wedge, causing vibrations. Automatically compensate for hard spots and places that are not exactly round.

They follow work down to size automatically and then prevent further pressure that would grind work under size.

Work of operator is lessened, enabling him to attend more than one machine on most work.

Adjustable Bronze Shoes

A convenience that obviates necessity of carrying a large stock of solid shoes of different sizes. Furnished with Universal Back Rests.

Send for copy of our book, " Cylinder Grinder "

The above is our 25 K.W. butt-welder, capacity ¾ in. to 1½ in. round and 2 in. pipe.

Convertible clamps for welding flats and bands.

We make other sizes of butt-welders and a full line of SPOT welders.

Write for catalogue.

AGNEW ELECTRIC WELDER CO.,
WALKERVILLE, ONT. **Limited**

Straight from the Shoulder

to the perfectly ground and perfectly tempered tip is every "Detroit" Twist Drill. Straight from the shoulder and perfectly true is every statement we make about them in our advertising.

"Detroit" Twist Drills

run true and are absolutely accurate in size because the body and shank are ground on their centers after hardening. Likewise you'll find the lip angles of every "Detroit" Drill absolutely equal. This means that both lips cut all the time.

They insure the greatest economy in all operations where drills are used and a test will prove it. Send for a trial order to-day.

Every one guaranteed.
Look for the trade-mark.

Catalogue "R" is arranged in two colors, black and red, for ready reference. Ask for a copy.

DETROIT TWIST DRILL COMPANY

Improving Twist Drills Since 1886.

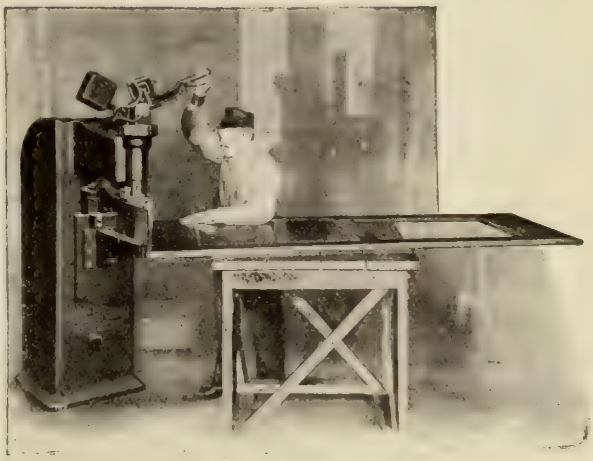
Sold by

E. B. Plewes,
120 Lombard St., Winnipeg, Man.

Walkerville Hardware Co.,
Walkerville, Ont.

The Foss & Hill Machy. Co.,
344 St. James St., Montreal, Que.

Riveting Costs Reduced



It's the Electric Way

Manufacturers of steel doors find they can increase their output over 100 per cent. by spot welding, as shown above; 60 per cent. stronger and 85 per cent. cheaper than riveting. No holes to punch, no rivets used. It's the rivetless riveter. Our No. 12 free bulletin tells all about them. No. 11 bulletin tells the story of butt welders. And we have a 30 days' free trial proposition for you.

NO LEASE. NO LICENSE. NO ROYALTY.

ECONOMICAL SERVICE

Is What You Will Get Every Day if You Use the

"ECONOMY"

14 Inch Motor Driven

DRILL

Years of experience and our aim to produce the world's best machines are responsible for the workmanship and design of this drill.

The "Economy" has a tilting table which can be tilted at any angle, enabling the operator to quick and easy work of difficult jobs. There is also a triangular bracket.

Drop a card for full Particulars.

Ideal Way To Buy Machinery

¶ The most satisfactory method of purchasing machinery, were it possible, would be to go to some great big supply house in which **every reliable manufacturer was represented.** There, at your leisure, or in a hurry if time was a factor, you could examine and select the machine best suited to your requirements.

¶ Such a supply house is, of course, not in existence, but a remarkable substitute is to be found in this Directory.

¶ The manufacturers represented in it are reliable, and you will find it greatly to your advantage to write for catalogs and literature relating to the machinery in which you are interested and intend purchasing.

Use Canadian Machinery when in the market for equipment or supplies.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

MACHINE-SHOP WORK

MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

MECHANICAL DRAWING
KENISON
AMERICAN SCHOOL of CORRESPONDENCE
CHICAGO ILLINOIS

MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price **$1.00**

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price **$1.00**

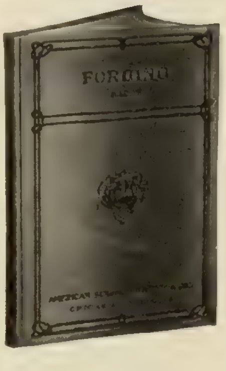
PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price **$1.00**

MACHINE DESIGN
GRIFFIN

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price **$1.50**

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels —annealing, tempering, spring tempering, hardening, case - hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price **$1.50**

TOOL MAKING
MARKHAM
TOOL MAKING
AMERICAN SCHOOL of CORRESPONDENCE
CHICAGO ILLINOIS



FORGING. By John Lord Bacon, Eng. and Supt of Construction, with R. P. Shields & Son, San **Diego**, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working hand-book of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price **$1.00**

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

GRIP NUTS

This Picture was taken 14 months after the Grip Nuts were applied. The report is that not a nut was loose; the test was entirely satisfactory, and that Grip Nuts will be generally used as the result of this test. The test was instituted and conducted by an official of the mechanical department of a leading railroad, whose name will be furnished to proper parties by permission. We will cheerfully furnish sample nuts. Send us diameter of bolt.

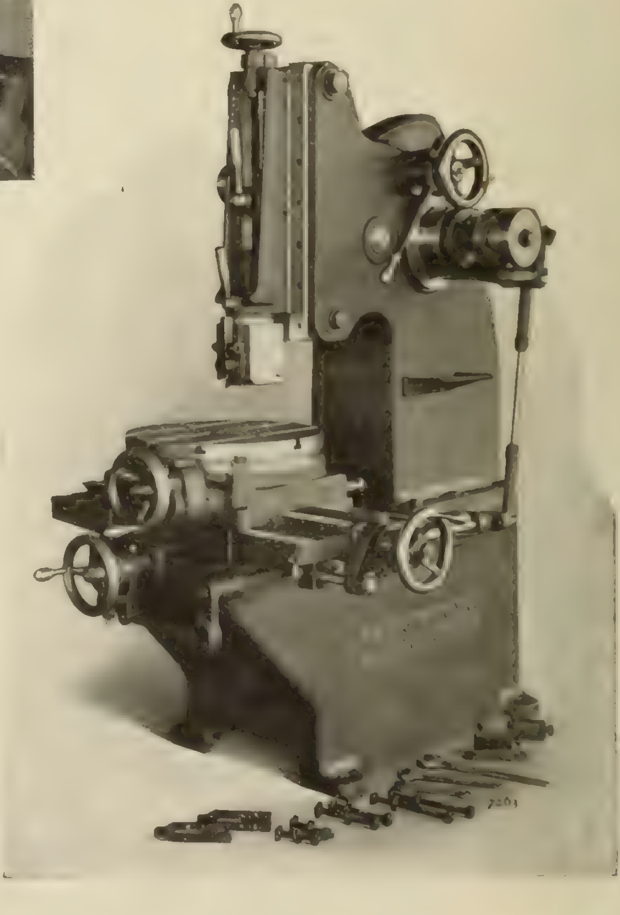
Have You Work Requiring Perfectly Parallel Sides

The swiveling ram head on the

P. & W. Vertical Shaper

will enable you to finish the job complete without changing the original setting and with a high degree of accuracy.



Here's the Way the Vertical Shaper Handles Square or Parallel Work

The ram head is set in the most advantageous position for the first side to be machined and is then firmly clamped. After finishing this side the head is swiveled through 90 deg. or 180 deg., as the case may be. The table is then fed in the proper direction, the machine being provided with automatic quick-acting feeds. By this method of swiveling the tool instead of the work the accuracy of the parallel or square sides does not depend upon the setting of the table but on the construction of the machine. On long, awkward jobs this method is especially convenient.

Write for illustrated circular "Vertical Shaper."

KEMPSMITH PLAIN MILLERS

Concentrated Operation.

Convenient Handling.

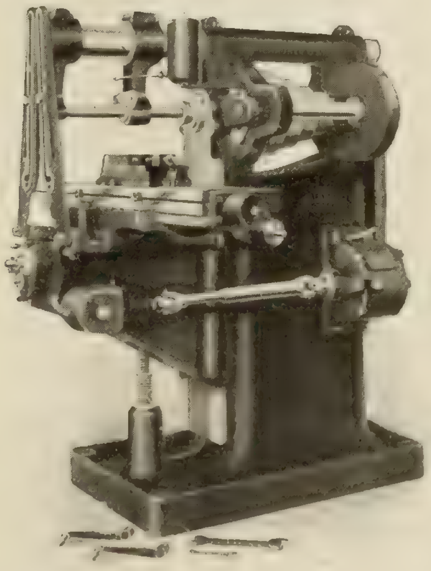
No confusion or complicated levers or parts.

No weak, delicate, limiting point.

Massive Construction.

Highly developed geared feed change and tripping mechanism.

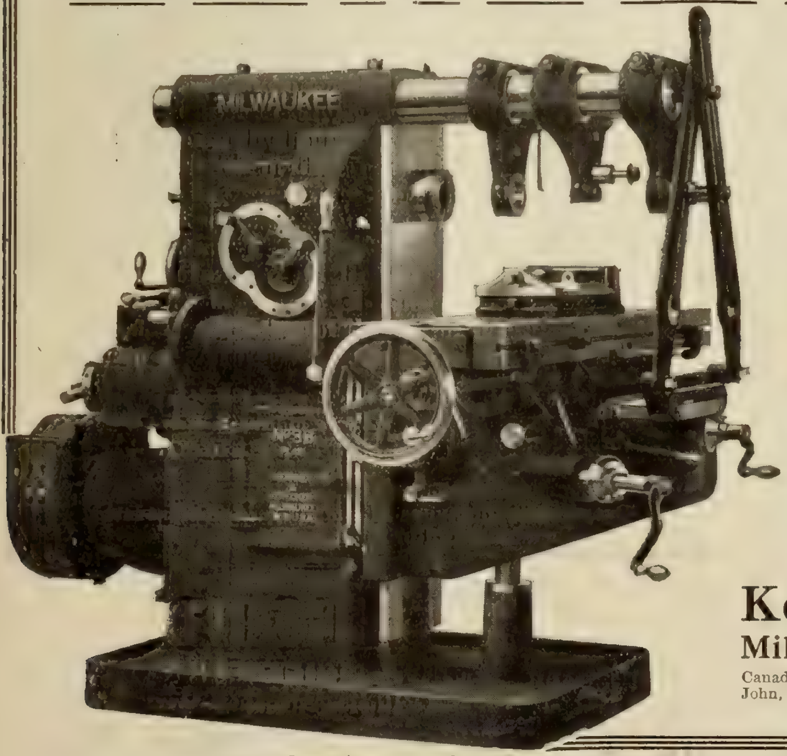
The Machine for ready handling in steady, severe service.



THE KEMPSMITH MFG. COMPANY

MILWAUKEE, WISCONSIN

If every machinist knew the merits of the MILWAUKEE MILLER and every machinist could have the machine that he wanted, there would be no other milling machines in use anywhere.



First appearances do not belie—for the MILWAUKEE MILLING MACHINE is good, through-and-through.

It is the working-out in steel and iron of the best thought of men whose lifetime ambition has been to make a machine that shall be right in principle and perfect in every smallest detail of material and construction and to make a **better** machine than anybody else ever made—whatever the cost.

TWO OVER-ARMS—an exclusive feature of the Milwaukee Miller—give it great rigidity and strength. Rigidity means accurate milling. Strength means machine life-insurance.

Note too that the box knee is solid, not slotted on top.

Lubrication is ideal. All bearings are flooded with **running** oil—a continuous drenching that carries away grit. A pumping system makes this circulation continuous.

Send For Our Illustrated Literature.

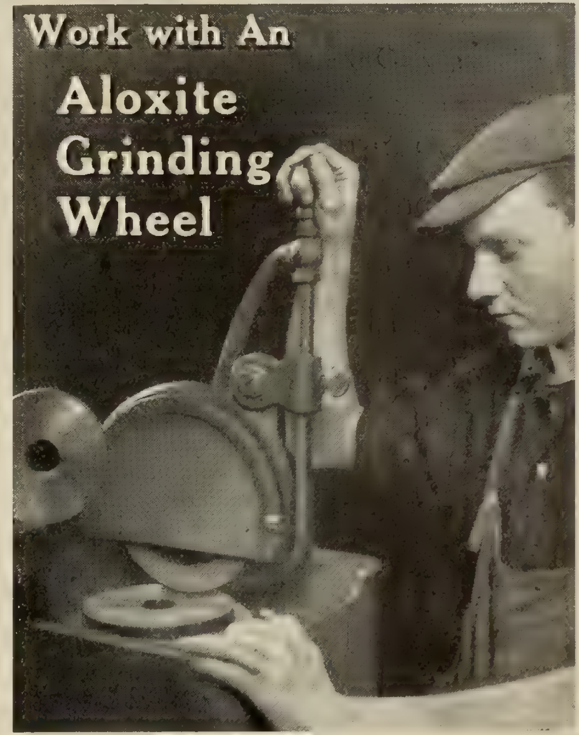
Canadian Agents:—A. R. WILLIAMS MACHINERY CO., Toronto, St. John, Winnipeg, Vancouver. WILLIAMS & WILSON, Limited, Montreal.

It's Like Putting an Old Head on Young Shoulders—to have Him



THE right wheel in the right place enables this operator to turn out accurately surfaced—perfectly finished—hardened Scottish steel collars.

The wheel is so good that he not only produces one-third more work, but better work than ever before.—With more experience the results would be even better.

The wheel lasts half again as long as others—doesn't fill—holds its grinding face.

Good grinding judgment upholds the theory of having *the right wheel in the right place*—of consulting our service department.

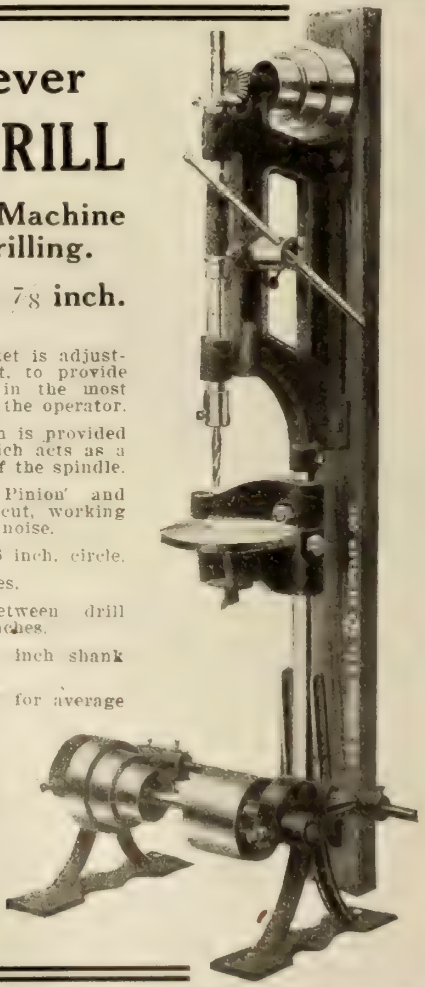
A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16 inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½ inch shank twist drills.

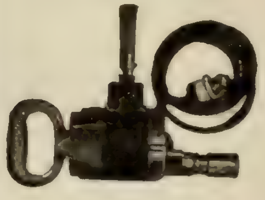
Speed of countershaft for average work, 300 per minute.

A. B. Jardine & Co.

Hespeler, Ontario

U. S. Electric Drills and Grinders

Save Time, Labor and Money

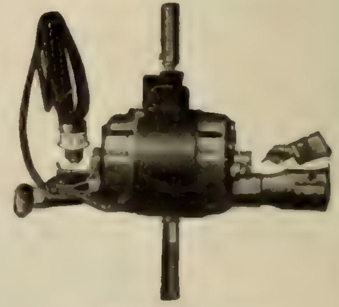


They can be attached to any lamp socket.

For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

3 SIZES.

3-16 inch,	W.G.T.	6 lbs.
¾ inch,	W.G.T.	9 lbs.
⅜ inch,	W.G.T.,	12 lbs.



All motors wound for 110 or 220 volts. Direct or alternating current.

Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.

½ inch—2 SPEED.
Speed, 400-750 R.P.M.

A Man Succeeds Because He Thinks Success

Some day, perhaps, we will establish a university, a school, to educate boys and girls that poverty and failure were never included in the scheme of the world.

¶ Thousands of men who have succeeded had no better chance, perhaps a chance not half so good as thousands of others who have failed. This fact is gradually becoming clearly and definitely fixed in the average modern mind.

¶ A man succeeds because he thinks success. Because he has prepared himself through nights and days of work and study to take advantage of something worth while on the day it arrives. The man who frees his mind from rubbish, from self-complacency, is the only man who is in a physical, moral and mental state to accept something big when it comes his way.

¶ The principle that the man who doesn't succeed is the man who deserves to fail, is dawning in the eastern sky. There are objections to this universal fact, just as there were objections to the idea that the earth turns on its axis, a century or so ago.

¶ You say that men have worked hard, have struggled against uneven odds, and failed because success was impossible, because the thing itself was against the man, but the answer still stands unmoved and undisturbed. We must establish a principle that the man who has succeeded deserves to accomplish what he did, and we will always have a few apparent exceptions to this law, in order to prove its unchangeable existence.

¶ We know that the great percentage of all men in all lines are failures and we know equally well that most men who have failed financially and morally, are those who first failed mentally and physically. A man knows whether he is making progress, or whether he is on the down grade and if this is a fact, to whom, to what place are we to look for the solution but to the individual himself.

¶ You analyze a man who has made a success of anything and you will find a strong fibre running through his entire make-up. We have long had a tendency to sympathize with the failure, and sympathy is a great and noble thing, but we cannot run the race of Life with cripples, any more than we can run the Grand Prix or the Belmont Sweepstakes with crippled and untrained horses.

¶ Life and business is a question of survival. We are as strong as our opposition. If we hesitate to arise in the morning, if we stay a little while for a few minutes more sleep, we are beating a retreat, hoisting the white flag—avoiding the thing we must overcome.

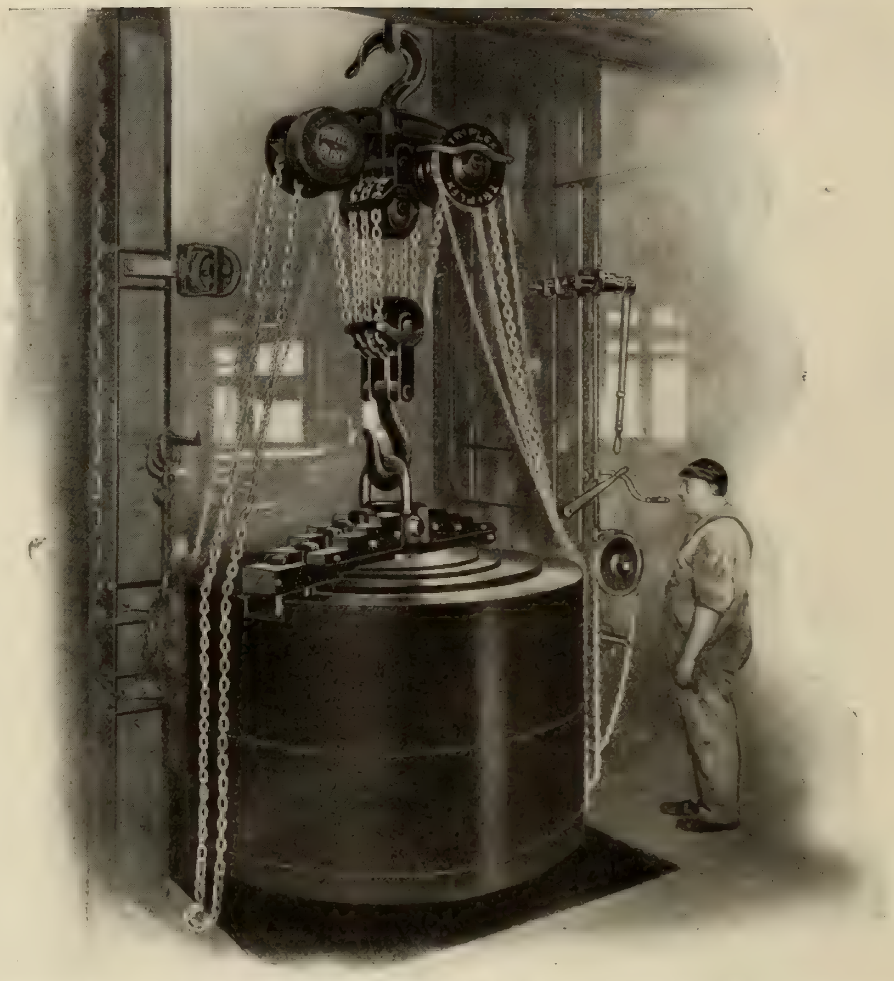
¶ Everything is as strong as its resistance. The man who has failed is the man who has evaded. This is the modern Gospel that is preached in business. The earlier this fact is fixed in the mind of the individual, the greater and surer will be his success; and the greater the number of men who discover this principle of life, the greater and better will be our Time.

¶ Some day, perhaps, we will establish a university, a school, to educate boys and girls that poverty and failure were never included in the scheme of the world. That the man who possesses strength of character, the man who is reliable, the man who inspires confidence, will always find capital to back him in his plan.

¶ Men and institutions with money are waiting for men with individuality and personal power in order that they may use an individual of this type to invest their surplus funds as these men know only too well that money unused is junk,—and money can be used only through the medium of the individual.

Efficiency

THE TRIPLEX BLOCK



Testing the Safety of each block, by overloading it 50% in long tons in the Yale & Towne factory.

Why the Overload Test is so Important

If a 2-ton load, being lifted by a chain block, should adjust itself in its sling and have a free fall of less than one-quarter of an inch, it will strike the entire block and chain a drop hammer blow of 6,000 lbs., and unless that block has been built, rated and tested for a fifty per cent. overload, an unrevealed defect will cause it to fail and come down with the load. It may crush the life or the limb of the worker. Prevent this harrowing experience. It will surely come with untested chain blocks.

YALE & TOWNE
HOISTS

Unknown defects must cause them to collapse under 6,000 lb. blows.

Triplex Blocks are absolutely safe to the user, for all load bearing parts are steel—steel hooks, steel gears, steel chain, steel load sheave and steel driving pinion. The only chain blocks built in America tested to overloads 50 per cent above rating, to reveal all defects, are the chain blocks built by Yale & Towne.

Send now for your copy of the Book of Hoists. It is an illustrated engineering report of safe handling practice.

EVERY BLOCK TESTED TO 50 PER CENT. OVERLOAD.

TRIPLEX BLOCKS { 16 Sizes: One-quarter of a ton to forty tons.
300 Active Stocks all over the United States and Canada.

Also Duplex Blocks, Differential Blocks and Electric Hoists.

Practical Data Relative to the Erection of Shafting

By Joseph Horner

Shafting for the transmission of power through belts, ropes, gears, etc., forms a prominent feature of our factories and industrial plants generally. The necessity of giving its installation more than ordinary attention, and the points to be observed when doing so, are fully dealt with by the writer in the accompanying article.

THE friction of shafting is very considerable even under the most favorable conditions, while, under bad conditions, it is excessive. The chief cause of the latter may be summed up in a phrase—lack of alignment. Three things are contributory to this—shafts bent and crooked, bad setting and fixing of bearings, and the effects of settlements and wear and tear. The results of each of these are much worse with rigid and plain bearings than with swivel, ball and roller bearings, but they occur in greater or less degree with all types. Departure from absolute accuracy should be avoided, because the effects are liable to be cumulative. One element of error may act in a fashion which will add to and increase that of another kind instead of neutralizing it. The shaft and bearings may be out of truth in opposite directions, and one bearing may be out in the opposite direction to the adjacent bearings. Accuracy, therefore, in each element is essential, if the truth of the whole system is to be maintained.

Difficulties of Erection.

What renders the alignment of shafting so difficult to secure in the first place is that there is no very tangible datum line from which to operate. There is nothing corresponding, for example, to the surface of a lining off table, or the bed of a machine, or an angle bracket or machine centres. Everything must be primarily referred to the spirit level and plumb line or water trough, and all tests must be made by these alone. The very refined methods of the machinist have no scope here, although the ultimate results should be nearly as exact as those obtained by the machinist. The work is nearly identical with that of the erection of large structures, such as fixed cranes, overhead travelling and gantry cranes, conveying systems—work which is done by men who are fitters or millwrights and specialists in erection where plumb lines, levels, straightedges, parallel strips, straining lines, packings and their adjustments, are the principal aids.

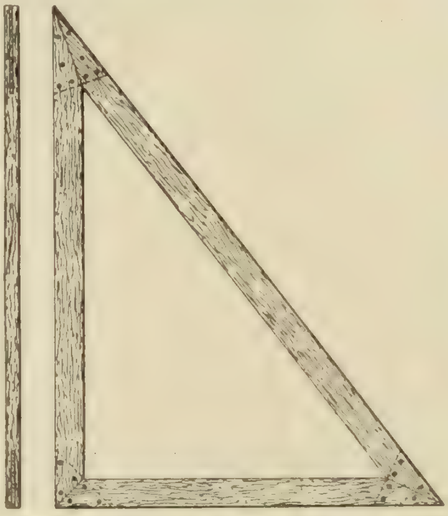

FIG. 2. LARGE WOODEN SQUARE.

Weak Shafts.

Bent and crooked shafts have also been a fruitful source of friction in shafting, much more so in the old days of wrought iron shafting than at the present time when the employment of steel is universal. The sight of weak, wobbling shafts was a common one some years ago. They were weak in themselves and inadequately supported by their bearings. At that time it was usual to turn only the journal ends of the shafts, together with such short sections as had to receive pulleys or gears. The principal portion of the length being rough, as rolled, tended to develop wobble and eccentricity, especially as the shafts were nearly always too weak for their work. Moreover, they became in time overloaded by further additions of pulleys and gears, which they were never originally intended to carry, with the inevitable results of sag and wobble. From such bad practice, steel shafting and more enlightened methods have come to the aid of millwright. Stiffer and stronger, although lighter, steel shafts do the work of the heavier wrought iron ones, with reduction of friction. They are supplied either turned or rolled.

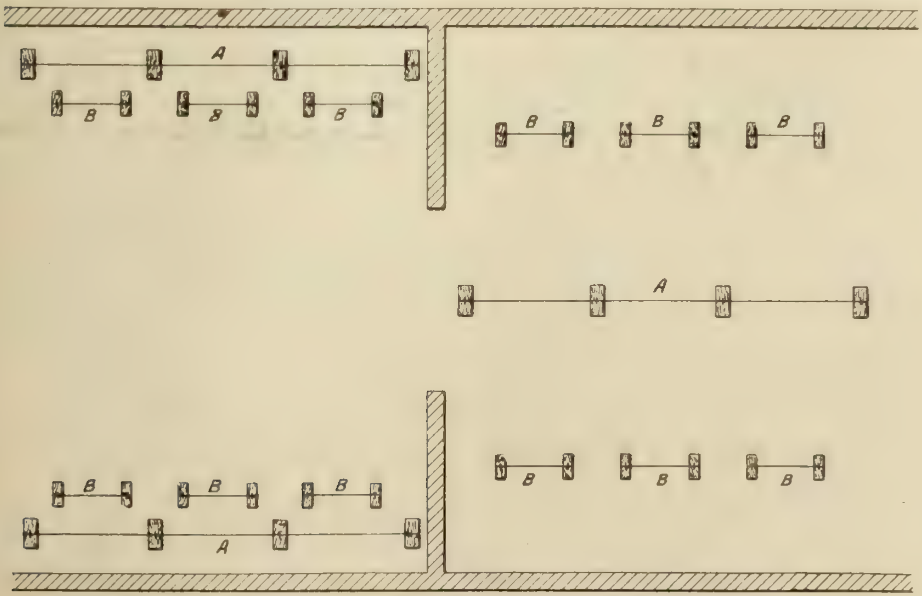

FIG. 1. ALTERNATIVE ARRANGEMENTS OF SHAFTING.

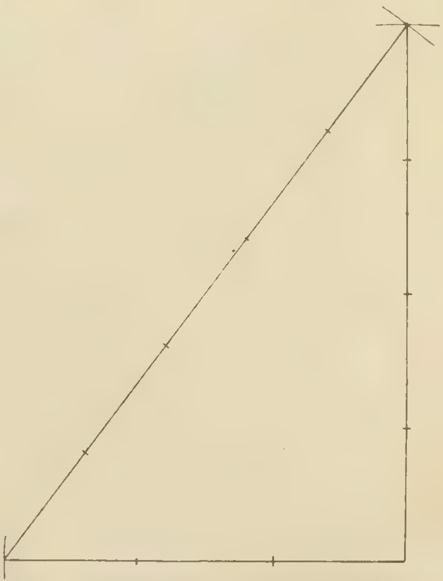

FIG. 3. ERECTING A RIGHT ANGLE.

Inaccurate Fixing of Bearings.

Bad setting and fixing of bearings may double the friction, and so produce injurious heating and cutting of journals, thereby necessitating more frequent and copious lubrication than if bearings were properly aligned. Excellent results may be obtained with the old style of rigid bearings, if they are aligned correctly, and bad results follow, on the other hand, with adjustable bearings poorly set. The latter, however, are preferable, because they accommodate themselves to slight inaccuracies, and mask and neutralize the effects of indifferent workmanship.

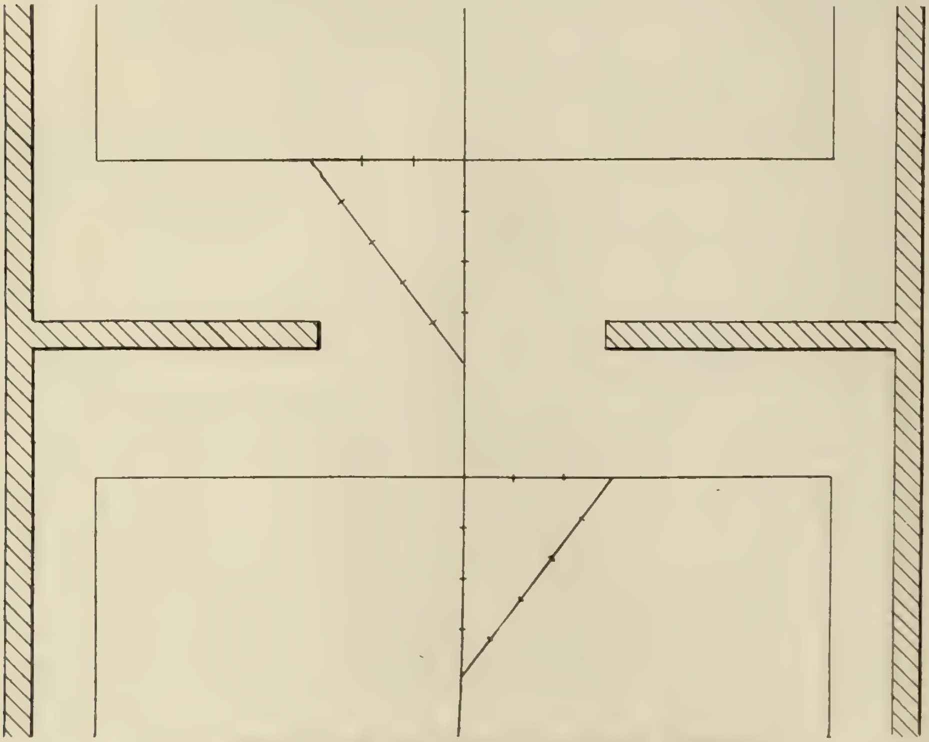

FIG. 4. CARRYING LINES FROM ONE SHOP INTO ANOTHER.

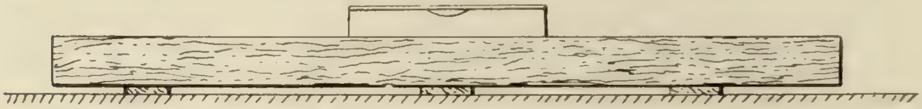

FIG. 5. LEVELLING DATUM BLOCKS.

The Influence of Wear.

The effects of wear and tear are more serious with rigid bearings than with adjustable ones, for, although bearings are set in absolute alignment, they may get out of truth in a year or two, in consequence of slight movements in beams, walls, foundations, which movements may increase with more or less irregularity. Corrections and readjustments will, therefore, be more imperative if the bearings are of rigid type than if they are self-adjusting. The risks of settlement are not very serious in the basement of a well-constructed building, or in the beams of a substantially built one-storey shop, but they are always present in the storeyed shops, where the beams which carry the floors have also to carry the shaft bearings. The floors sink and the beams become distorted. This is especially noticeable in new shops, if the shafting is erected before the machines are laid down. Then subsequent corrections are inevitable.

The Lay-out of Shafting.

With regard to the disposition of line shafting, this must be governed by the features embodied in the design of the building. In a narrow shop it is usual to fix the line shaft bearings to one wall. In large modern shops, having bays separated only by columns, the bearings are attached to these columns, and the belting drives from each side, or the hanger form of bearing may be used and bolted to the under sides of the joists above, which are part of the roof principals, or which sometimes support an upper floor. The methods by which the bearings are attached to walls, columns or joists vary greatly, and the fact that they are designed to suit all conceivable conditions, explains the differences in the shapes and means employed.

Methods of Erection.

There are two ways of erecting shafting; one, which is by far the better, consists in working from the floor, while the other involves working from the beams above. Such beams, however, are often absent. The first can always be adopted in a new shop, but if the floor is already occupied with machines, the second plan may be accepted, although it is preferable, with the modern style of roof, to attach the bearings to columns. Frequently, in smaller shops, timber beams are bolted along the roof principals solely to receive the counter-shaft bearings.

Erecting From the Floor.

In working from the floor, the positions of the shafts to be erected are laid down upon it, beginning with the main line shaft or shafts. From these are marked the secondary lines and the coutershafts. In Fig. 1 two common alternative dispositions of shafts are outlined in diagram in plan. In that to the left, the line shafts (A) (A) occupy the sides of the shop, driving to the countershafts (B) (B), farther away from the walls. In the other to the right, one line shaft (A) runs down the centre, and drives to the counters (B) (B), right and left. The latter is not always practicable in wide shops, but is more economical in those of moderate width.

Laying Down Centre Lines.

When lines of shafting occur at right angles, a square is hardly correct enough to use, unless a very large wooden one, measuring several feet along the sides, is made and kept for the purpose, like that shown in Fig. 2. It is made of narrow strips of wood abutted at the corners and tongued, with the pieces fitted

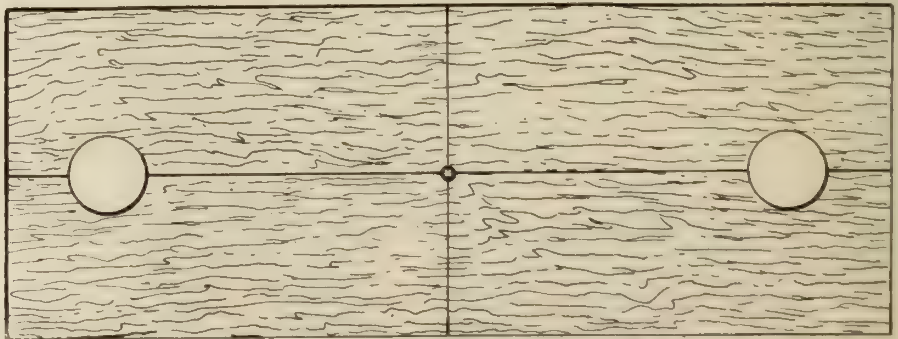

FIG. 6. TEMPLET FOR MARKING BOLT HOLES.

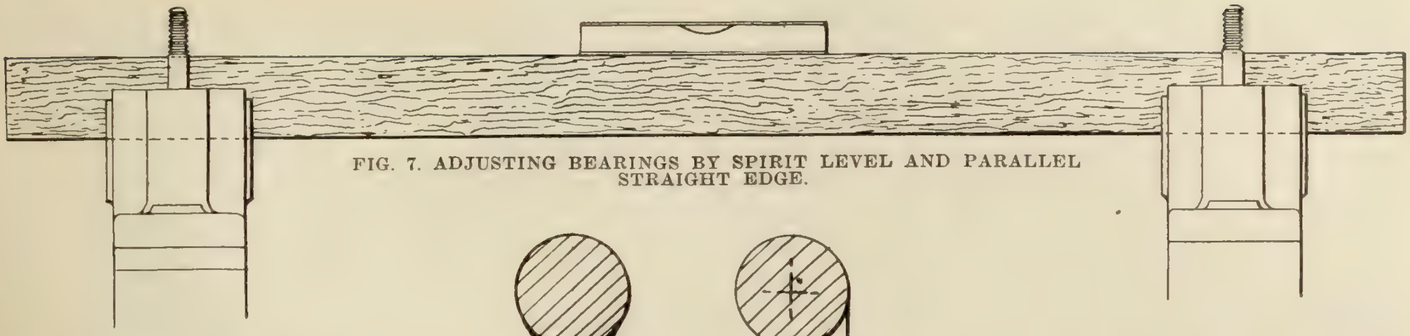

FIG. 7. ADJUSTING BEARINGS BY SPIRIT LEVEL AND PARALLEL STRAIGHT EDGE.

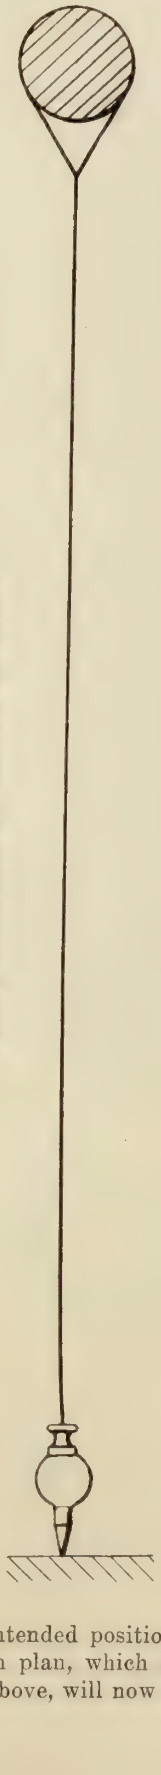

FIG. 8. PLUMBING BY CENTRE OF SHAFT.

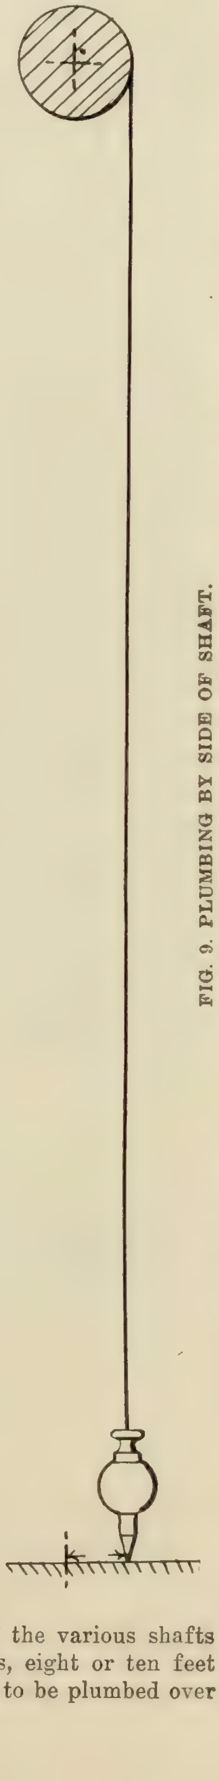

FIG. 9. PLUMBING BY SIDE OF SHAFT.

and glued into a saw kerf, and all secured with glue and screws. Such a square, apart from rough usage, maintains its accuracy permanently, yet the geometrical relation, of (3), (4), (5) Fig. 3, is better. Feet or yards can be used according to the lengths of the shafting, and a trammel employed to lay down the dimensions, or a light rod marked off in the lengths required. The lengths (3) and (4) will be at right angles with each other.

This is plain sailing, when the work lies on the floor of one shop, but when shafting has to pass through walls into adjacent shops, one has to be careful, since measurement from walls is not considered permissible. A correct method, then, is to use the doorway to carry a datum or centre line through from one shop into the next, Fig. 4, extending either along the whole length of each, or for as much of the length as may happen to be required. From it the centre line or lines of shafting can be set off parallel on the floor. When parallel lines of shafting are required on opposite sides of a wall, as in Fig. 4, additional care must be exercised. If the length of one shop is enough to be a guide, a long fine line can be safely stretched to coincide with that line laid down, and extended into the one adjacent. If not, the most suitable method to adopt is to raise a vertical (B) from the centre line (A), Fig. 4, already existing, and from that to raise another vertical (C), which will then be in line with the first. The relation (3), (4), (5) will be used.

Centre lines are snapped with a fine chalked cord used in the same way that wood workers do. It is held taut by a man at each end, while another at the centre lifts it a few inches perfectly plumb, and lets go sharply. A fine chalked line will thus be transferred to the floor. As many lines are snapped as there are lines of shafting, all being set down by careful measurement parallel with or at right angles with each other. At the end of each line a small nail is driven in to be a permanent record in case the lines should become obliterated.

Levelling the Basis Line.

These datum lines correspond with the intended positions of the various shafts in plan, which shafts, eight or ten feet above, will now have to be plumbed over them. The horizontal truth of the shafts has to be set in the first place by measurement and then checked by a spirit level. To accomplish this a level base is required on the floor. A convenient method is to nail strips across on the centre lines, Fig. 1, corresponding with the positions over which the bearings will be plumbed, and reduce the surfaces of some or of all with a plane until a parallel straight edge carrying a spirit level, and moved across from one to the other, Fig. 5, shows that they are level throughout. At the intersection of the centre line of the shaft with the centre of each bearing, a small nail is driven in as a permanent witness. From these nails as centres the bearings are fixed, the methods of doing which vary with the designs and methods of attachment.

Instead of fastening datum pieces on the floor to obtain a truly horizontal base, a long narrow water trough has been used, although a more compact method still is the hydrostatic level of the Webster Manufacturing Co. In this, two vertical tubes are connected with a length of hose fitted with stop cocks. The height of the water in the tubes, set any distance apart, gives a true level. The level can be graduated in inches and parts of an inch within a range of 3½ inches.

Approximate Settings.

From this point of departure, bearings may be fixed as plummer blocks to beams overhead, or as hangdown bearings from beams, or as wall brackets of various shapes. Different means are necessary in each, and these will be considered in turn. Also, the work is naturally divided between two stages, the first being more or less approximate, the second corrective and exact.

Fixing Plummer Blocks on Beams.

The first thing to do is to get a centre on the underside of the beam plumb over the corresponding centre on the floor. This is easier said than done, with a bob swaying very slowly to rest. A boy below must steady the bob while the man makes adjustments on the ladder. The cord may be held in the fingers, and from it a centre be marked on the underside of the beam to correspond with that below. A templet has to be prepared corresponding with the foot of the bearing, or of its separate sole plate if such is used, the bearing or sole plate, as the case may be, having to be bolted on top of the beam. The templet, Fig. 6, has a centre bored in it and two bolt holes, or four, to correspond with the bolt holes in the foot or in the sole plate. The templet is laid against the lower face of the beam, and centred through its centre hole to the hole already plumbed up from below. The bolt holes are then marked through it, and bored with an auger as perpendicularly as possible. Instead, however, of proceeding in this way, it will be rather easier to pass the plumb line through the centre hole in the templet, lay the latter on the lower face of the beam, clamp it tightly, and adjust it by tapping the edges until its centre is right. The bolt holes can then be marked through, the centre marked by the intersection of the two centre lines on the templet, transferred to the beam and scribed.

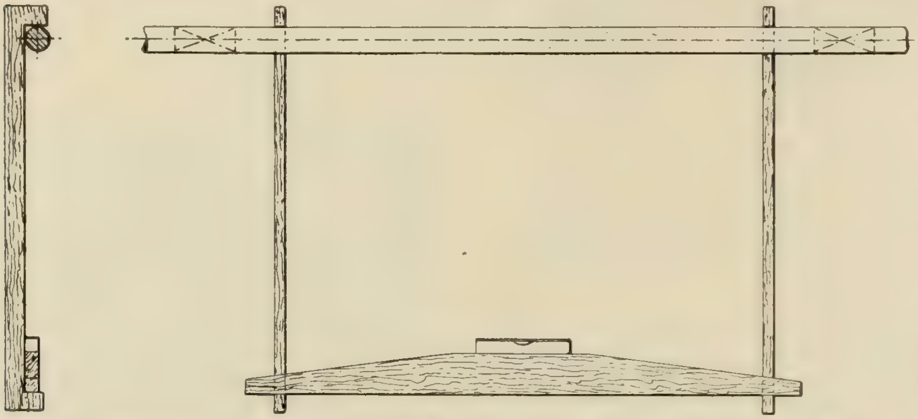

FIG. 10. ALIGNING SHAFTING WITH STRAIGHT EDGE, SPIRIT LEVEL AND SUSPENDED RODS.

By means of the bolt holes, the bearings will be loosely set and attached in place on the top of the beam, but not finally tightened up until they are tested carefully for plumb. Usually, ⅜-in. of play across the line of the shafting is allowed in the slot holes of plummer block feet or sole plates to permit of adjustment, and to compensate for the rough character of the holes bored. If the bearing fits on a sole plate, the former usually alone has adjustments on the plate, and if bolted directly to the beam, its foot has slot holes.

Packing Up.

Bearings of ordinary form have no provision for vertical adjustment. These, therefore, or their sole plates, usually require packing pieces to level them up to compensate for inequalities in the beams. They, also, are fitted before the bolts are finally tightened. The approximate thickness of packings required can be obtained by sighting along the series of beams with a surveyor's level, and getting an assistant to mark the height or thickness of each packing on a strip of wood laid on the beam. Pieces will then be planed to those thicknesses, and laid under the sole plates or the plummer blocks, after which the exact levelling will be done directly from the shafting, which is now inserted. This may be done before the final lateral adjustments, or subsequently, preferably, the latter.

Checking for Level.

Before laying the shafting in its bearings, much subsequent adjustment may be avoided by laying a parallel straightedge in the bottom of the open bearings and trying a spirit level on the straightedge, Fig. 7. The straightedge can be shifted from bearing to bearing along the whole line, and the thicknesses of the packings corrected. When each contiguous pair of bearings is levelled thus, one from the other through the series, the whole must be in alignment. The shafting can then be laid in.

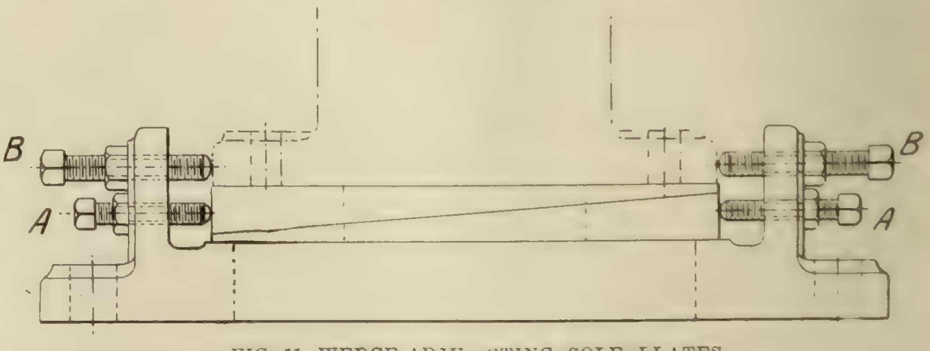

FIG. 11. WEDGE-ADJUSTING SOLE PLATES.

Use of the Straining Line.

The straining line is of fine hard brass or copper wire. Owing to its deflection, it cannot be used with accuracy for horizontal adjustments, the straightedge and spirit level being much more reliable, preceded, if desirable, by measurement up from the datum blocks on the floor by means of a rod. If, however, it is strained by a weight at one or at both ends, the wire passing over pulleys, most of the sag can be pulled out of it and allowance made for the slight residium by sighting along. It may also be supported in each bearing, on a strip of wood bridging the bearing, flush with the joint, and then sighted along. When adjustable bearings are used, this is accurate enough for the preliminary adjustments, leaving the final ones to be made with the spirit level, after the insertion of the shafting.

The straining line of wire is, however, more properly employed for making lateral alignments, being usually strained along the edges of the open bearings before the shafts are inserted. It may, however, be strained along the centres, but in that case the bearings must be bridged with strips of wood on which the centre lines will be scribed.

Making Lateral Adjustments.

Lateral adjustments are made or checked also, by the centre lines on the floor by plumbing down from the shaft itself. This may be done by looping a cord round the shaft so that the cord hangs from the centre with the plumb bob on the end, Fig. 8, or the line may be hung over the shaft at one side, in which case measurement must be taken from the bob to the centre line, Fig. 9, the distance being, of course, one-half of the shaft diameter. The bearings are tapped laterally in one direction or the other until these adjustments are made correctly, after which the bolts may be tightened up provisionally.

There are short cuts available in cases where a large number of bearings are in question, as occurs in long lines of shafting. In such circumstances the intermediate bearings can be adjusted laterally by means of a cord strained along the whole length to form a datum for the lateral alignment. A cord is dropped from each end of the shaft and the datum line strained along just in contact with these. From each bearing, a line is dropped and adjustments are made until each line makes contact with the horizontal cord.

Horizontal Adjustments.

To effect the final adjustments of shafting horizontally, a spirit level placed directly on it would not give accurate results. A better method is to lay a long parallel straightedge and place the spirit level on that so as to check its departure from truth and make adjustments by the thickness of the packings, taking a few shavings off those where the bearings stand highest. This involves getting up and down ladders; a neater way, therefore, is to hang hooked rods contiguous to adjacent bearings, Fig 10, lay a parallel straightedge on the lower hooks, and test with a level laid on the straightedge, and so on through the series.

Alternative to the wood packings previously mentioned, the use of folding wedges, Fig. 11, affords a more convenient mode of adjustment. The wedge pieces are sufficiently wide to reach across the width of the plummer block base, and are slotted through from each end for the bolts. The lower screws, (A), four in number, effect the adjustments of the two strips, and the upper ones (B,) of which there are two, adjust the lateral position of the plummer block.

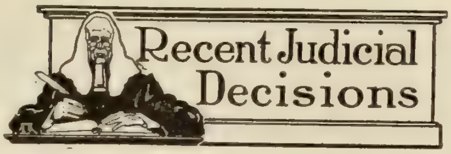
◆

NEW C. P. R. YARDS.

It is expected that the new yards of the C. P. R. at North Transcona, east of Winnipeg, will be in full operation by September 15. About 45 miles of tracks in the yards are being used, and, on the day mentioned, an additional 47 miles will be ready for use. The cut-off connecting the west part of Winnipeg with the yard has been completed with the exception of the bridge, the piers for which are being put in. The completion of this structure will enable the bringing of the grain traffic direct into the yard instead of hauling it through the city. An agreement has been reached between the C. P. R. and the city of Winnipeg to remove the present subway at Main Street, and to build a new one considerably wider and six feet higher, the work to be done within two years.

◆

To face a cast-iron pulley with leather, apply acetic acid to the face of the pulley with a brush, which will roughen it by rusting, and when dry, apply a cement made of 1 lb. fish glue and $\frac{1}{2}$ lb. of common glue, melted in a mixture of alcohol and water. The leather should then be placed on the pulley and dried under pressure.



Recent Judicial Decisions

Hamilton, Ont.—Mr. Justice Middleton gave judgment at Osgoode Hall, Toronto, June 27, in the action brought by a contractor named Dick against the Standard Underground Company, of Hamilton, to recover payment for work done under a contract, which he did not complete. Defendants denied liability and set up a counter-claim for the amount they paid for the completion of the work. His Lordship decided in favor of the defendants, and ordered Dick to pay them $15,701, without prejudice to any further claims they might have against him. The conduct of the contractor, said his Lordship, precluded his recovering damages for delay, but if on appeal, he was held to be entitled to such damages, they were fixed at $1,000.

Victoria, B. C.—The Westholm Lumber Co. has instituted an action against the City of Victoria, the Water Commissioners of Victoria, Water Commissioner J. L. Raymur, J. L. Beckwith, Mayor of Victoria in 1911; Wynn Meredith, Consulting Engineer of the Corporation; Alderman George A. Anderson, George Okeli, of the Finance Committee, and Boyd Ehle, Superintending Engineer of the Sooke Lake Waterworks Scheme. In a statement of claims filed in the Supreme Court registry by the company, the charge is made that representations made by the defendants were untrue in substance and in fact. The suit is for a declaration that the Sooke Lake Waterworks Contract be declared null and void. The contract was awarded to the Westholme Lumber Co. by the City of Victoria last December. It is alleged that defendants represented that they had acquired all the rights-of-way, the finance and the powers to enable them to construct the system, that they had made examination of the route and prepared estimates of cost and quantities, and that they had a complete plan of the works showing them to be located on the northwest side of the River Sooke, and that the grades for the system had all been established. The plaintiffs allege that this was misrepresentation. The Westholme Co. ask in addition to the cancellation of the contract that they be awarded payment for work already done on the scheme and also damages. Mr. Justice Murphy ordered that particulars of the alleged misrepresentations and dates of publication, etc., of the articles complained of be furnished, or else the clauses be struck out.

BALANCING TURBO-ALTERNATORS.

According to the Electrician, in United States factories, practically all turbo-alternators are balanced by a cut-and-dry process. The turbine is first assembled on the test floor, and connected to the steam and exhaust mains and to the oil and water systems of the plant. As the machine is driven under its own power, the test men determine which end of the machine is the worst by placing the forehead against the casing at different places. A weight is then inserted into one of the tapped holes provided in the rotor, and the machine is run up to speed and the result of the experiment is noted. If the vibrations are less violent but still noticeable, another and heavier weight may be inserted in the same hole. If the first attempt produces more violent vibrations, the weight is removed, and placed in some other part of the rotor.

Each tester generally has his own "follow-up scheme" of placing the successive weights. The process is continued until both ends of the turbine are free from vibration at the rated speed. When the generator is attached to the shaft, this process is repeated and weights are placed upon the ends of the rotor at various points on the circumference until all bearings and the casings of both the turbine and the generator are free from vibration as far as can be detected by placing the forehead against them. Many factories balance the rotors of their generators dynamically before they are assembled in the machine. Special apparatus fitted with delicate balancing mechanism is required for this work.

◆

"MADE IN CANADA" TRAIN.

The "Made in Canada" train, which started out from Montreal over the C. P. R., and which was entirely built at the Angus Shops at Montreal, has covered ten thousand miles through Western Canada, making calls at all points along the line to Calgary and Wetaskiwin, and down the Macklin-Outlook branch to Regina, and over portions of other railways. Many thousands of visitors took advantage of inspecting the well-fitted up cars, demonstrative of the manufactures of Canada. On Dominion Day it commenced its return journey to Winnipeg.

K. B. McDonald, who for the past two years has been factory manager of the Russell Motor Car Co. at West Toronto, has resigned.

Cutting Worm Gears for Motor Car Power Transmission*

By F. W. Lanchester

Compared with other forms of gearing, on the score of efficiency, modern worm gear seems able to hold its own. Samples of the Lanchester Gear taken from stock showed efficiencies varying from 95 to 97 per cent., as tested and certified by the National Physical Laboratory.

POWER-TRANSMITTING worm gear for motor-cars, to comply with two main conditions, must give an efficiency comparable, if not equal or superior, to the efficiency of the alternative types of gear—bevel or chain, and must be of approximately similar weight and size to a bevel gear of equal horse-power capacity. It was unnecessary to mention silence as a third condition, since this was the direction in which worm gear was notoriously beyond reproach, while on the score of efficiency, modern worm gear was well able to hold its own.

Samples of Lanchester worm gear taken from stock at the Daimler Works showed efficiencies varying from 95 to 97 per cent., as tested and certified by the National Physical Laboratory. On the score of weight and compactness, this gear did not compare unfavorably with bevel gear, and the size and weight of a rear axle for a given duty was approximately the same for both types. Apart from consideration of load carried, the efficiency of worm gear or screw gear was a function of the angle made by the teeth. Neglecting journal and thrust friction, or including such bearing friction in the total reckoning of tooth friction, the best efficiency was obtained when the worm tooth angle was 45 deg. minus half the effective angle of friction.

The maximum load that could be transmitted by any gear pair depended mainly on the type of worm or screw gear employed and on what tooth pressure the gear would stand without expelling the lubricant from between the engaged surfaces. In some cases, the limit was not the oil film, but rather the hardness of the materials of which worm and wheel were constructed.

Torque and Other Factors.

In considering the design of worm gear for a motor-car, whether a pleasure or a commercial vehicle, the conclusion was that the main factor in determining the size of the worm gear was the torque on the driving axle. Now, if it were proposed to propel any given vehicle with an engine of specified horse-power, that might be obtained by large cylinders and slow revolution speed, or smaller cylinders with higher revolution speed. It was evident, therefore, that a ready means was required to compare the power transmission capacity of worm gears of given centres, under conditions of constant driven torque and variable speed reduction ratio. It might be pointed out that, in certain cases, especially where noise was unimportant, a gear might be used between the motor and worm shafts in place of the direct drive, in order to accommodate a worm standard that might otherwise be unsuitable.

Selection of a Suitable Gear.

The selection of a suitable gear depended on four factors—the weight of the vehicle and the diameter of the driving wheels on the one hand, and the centres of the gears and the torque curve on the other. It was thus quite a simple matter to specify the proportions of the worm gear required for any given duty. In the design of different types of gearing, whether worm or spur, the important factors differed considerably according to the type employed, and even according to the ratios required. Thus, in spur gearing the strength of the teeth was a very important factor; while in power transmitting worm gears, the strength of the teeth need rarely, if ever, be considered, for designs which fulfilled the other necessary conditions were usually found to possess ample strength.

Again, in spur gearing, the pitch diameters, or, in the case of involute gears, the rolling circles, required to be selected exactly in the ratio of the transmission, and no departure was permissible. In worm or screw gear, on the other hand, no such rigid conditions existed, and the angle of the gear teeth might be selected to accommodate any diameters required. For given gear centres the gear ratio was a function of two variables—the size ratio of the blanks and the tooth angle—whereas in the ordinary spur gear the one variable alone determined the gear ratio.

Force Transmitted by Teeth.

It had been the author's custom, for many years, to express the force transmitted by the teeth as a pressure per square inch on the projected area of the worm wheel teeth. On this basis, worm gear cut according to his system would carry easily one ton per sq. in., and was good for an overload of two or three times that amount—in fact, a load of two tons per sq. in. might be regarded as a safe load, inasmuch as the gears would run satisfactorily with such a load for an indefinite period. Taking a car and passengers weighing two tons gross on a 1 in 12 gradient, there was roughly a tractive resistance with allowances for groad resistance of 0.2 of a ton, which represented on the worm teeth 0.8 ton on a projected area of approximately half an inch, or 1.6 ton to the inch. The gear would work quite satisfactorily and would show no signs of distress under these conditions.

Efficiency Feature.

The most important direction in which it was desirable to test worm gear was to determine its efficiency under various conditions of load and speed. Where the efficiency of any piece of mechanism was high, such tests, to be of any real service, must be carried out with a very high degree of accuracy. Thus, where an efficiency of 97 per cent. or thereabouts (as in a well-designed worm transmission) was obtained, it was useless to employ methods having an error of 1 per cent., more or less, for such an error might be regarded legitimately as a 33 per cent. error in the measurement of the power wasted in transmission.

If the tests were to afford anything of a nature useful to the engineer in the improvement of his methods of generating, or to enlighten him with reference to the best conditions under which worm gear was to be employed, he must be able to detect with certainty variations in the amount of power lost of a far less magnitude. It might be said that unless the loss of power could be determined to within about 5 per cent., the method was unsatisfactory. Thus, taking 96 per cent. as a good average worm gear efficiency, the loss of power was 4 per cent. and the determination should be within an error of one-fifth of 1 per cent. Such was the degree of accuracy obtained as certified by the director of the National Physical Laboratory by the new Daimler-Lanchester testing machine.

In principle, the new machine was an instrument for the direct comparative measurements of two torques acting about axis at right angles, or more generally about axis making any angle with each other, but unsuited to cases where the torque axis approached the parallel.

Many facts of considerable importance, both to the designer and to the user, had been elucidated by recent tests with the new method. It appeared that at the best the parallel worm could scarcely reach the efficiencies shown to be regular with the Lanchester gear. At the worst the efficiency of the parallel gear fell 3 or 4 per cent. lower, particularly in the case of heavy loads, and it was claimed that the oil film began to break down in the case of the parallel worm at loads which the Lanchester gear sustained without loss of efficiency. The loss of efficiency at reduced speeds was far less than had been previously supposed; at the lowest useful motor-car speeds it rarely fell much below 94 per cent., and it was quite exceptional to record efficiencies below 93 per cent.

---

*From a paper read before the Institution of Automobile Engineers.

Great variations in efficiency were due to differences in the lubricant employed. In general, mineral oils were much inferior to animal or vegetable oils. The viscosity of the oil was little or no guide in the selection of an oil for the purpose in question. Again, the efficiency might be lowered by the presence of too much lubricant in the gear-box. The best efficiencies were obtained with a certain perceptible tooth clearance, and the best clearance in an ordinary motor-car gear appeared to be about 1-64in.

PROTECTION OF BOILERS.

THE Cumberland Electrical Process for the Protection of Boilers has been introduced into the United States with a view to preventing the corrosion of boilers. It consists of the use of one or more electrodes installed in the boiler, and connected to the positive terminal of a direct-current supply, the boiler being connected to the negative terminal, and the water forming the electrolyte. It is stated that only enough voltage is required to overcome the resistance through the water, and any counter electromotive force due to the difference of potential of the metals of the boiler.

A report issued by the United States Navy Department states that some experiments were carried out on a small fire-tube boiler having brass tubes, with a steel shell, in which five polished steel plates were placed—one on the crown sheet, one across the top row of brass tubes, one across the tubes about the middle of the nest of tubes, one on the bottom of the shell-plate under the furnace, and one at the smoke-pipe end. The boiler being filled with water, steam was raised to 190 lbs. per sq. in. pressure, and kept up for five days, after which the boiler was examined.

There were no signs of hydrogen gas, and the electrode placed in the boiler was found to be considerably corroded. The brass tubes showed no corrosion, nor was there corrosion on the test pieces. Underneath the cathode, and on the tubes and shell, a deposit of black iron dust was found, which could easily be washed off. Old scale had also been cracked off the crown sheet and shell in places. The scale on the brass tubes was also cracked off in places, and could be easily washed away. The iron electrode in the water was, it is stated, very badly corroded.

CAPACITY OF ROUND TANKS.

THE accompanying table, taken from the "Motor Boat," giving the capacity of round tanks, will possibly be found useful in many departments of manufacturing and industrial plants:

		Weight in lbs. per inch.						
		Sp. G. 73	.796	,81	.85	.895	.93	1,0
Diameter in inches.	Gallons per inch.	Petrol.	Refined Paraffin.	Scotch Paraffin.	Crude Oil.	Lubricating oil	Fuel oil.	Water.

LOCOMOTIVE .SUPERHEATER DESIGN.

HITHERTO, it has been the almost invariable practice to design a locomotive superheater entirely without reference to the construction of the smoke-box, except, perhaps, as regards capacity. According to the Railway Times, however, Mr. S. M. Vauclain, of the Baldwin Locomotive Works, Philadelphia, proposes to construct the smoke-box in a special manner to adapt it for receiving and carrying the header of the superheater. The circular smoke-box is cut away at the top, so that its walls enclose only about 250 degrees. The uncompleted portion provides an opening sufficiently large to permit of the superheater header being passed through it from above, and this header is so constructed that it combines, with itself, a casting shell, which, when riveted to the smoke-box shell, complete the circular form thereof. The header casting also receives the joints of outside steam pipes—presumably for use with large Mallet articulated engines—so that all the connections and steam passages are combined therewith, the steam inlet pipe at the top, and the two delivery pipes from the superheated steam compartments of the header towards either side.

SARNIA WATERWORKS.

IN connection with the recent ceremony of turning the first sod for considerable extensions to the waterworks of the town of Sarnia, Ont., it is interesting to note that the Waterworks Commission have finally decided to install steam turbine-driven pumps, after having spent considerable time in investigating all other types, including the vertical high duty type of pumping engine.

The available speed of the pump is 1,500 r.p.m., this being fixed by the fact that at some future time it may be required to connect the pump to an electric motor to operate on the Hydro-Electric 25-cycle supply. Herringbone gears are to be used to connect the pumps to steam turbines operating at 3,600 r.p.m. By using this speed for the steam turbine, about 20 per cent. less fuel will be consumed than if the turbines were run at the same speed as the pumps. "Herringbone" type gears have been successfully employed for powers sufficiently large to drive steamships, are entirely enclosed in a cast iron casing, and are practically noiseless. There are two similar units to be installed.

The pumps are of the well-known Mather & Platt single stage turbine type, each capable of delivering 3,000 Imperial gallons per minute against 200 feet head, and the complete contract has been placed in the hands of the Canadian Allis-Chalmers, Ltd. The various units will be manufactured at their Montreal works.

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

INSPECTOR BENCH GAUGE.

By A. L. Monrad.

ONE might naturally think nothing of importance could be added to gauging nowadays, but, from things seen, and experiments made in the past few years many things have been learned which, no doubt, may interest some readers looking for information in this direction. While bench gauges are not new, as to design, they are really very much neglected. They are great time savers, if properly made, not only as regards accuracy but also as regards manipulation of the work, where thousands of pieces must be handled daily.

Referring to the assembled sketch (A), after the gun receiver has been machined on the inside and the holes drilled and reamed on both ends, the inside bottom cut is gauged to proper depth in relation to the holes on each end, as the gun bolt slides to and fro in the bottom cut, and in parallel lines with the holes. An allowance of two thousands of an inch is the limit allowed for a sliding fit, and any slight variation will show very distinctly on the multiple lever (B). The gray iron plate (C) is planed all over to 1 in. thickness, 6 in. wide, and 12 in. long.

The right hand block (D), of machinery steel and finished all over, is held in position on the cast iron plate, from underneath, with two fillister screws and two dowel pins. A hardened, ground and lapped plug (E) is driven into the block (D) in the proper location with the centre line of the plug, and a ⅞ in. slot is milled on the opposite side of the block (D). A hardened and lapped machinery steel piece (F) fits this groove and is held securely with a fillister screw (G) to the block. The plug (E) and the locating piece (F) are lined up, so that when the receiver (A) is in position on the gauge, the inside cut of the receiver is absolutely parallel, both ways, to the cast iron plate.

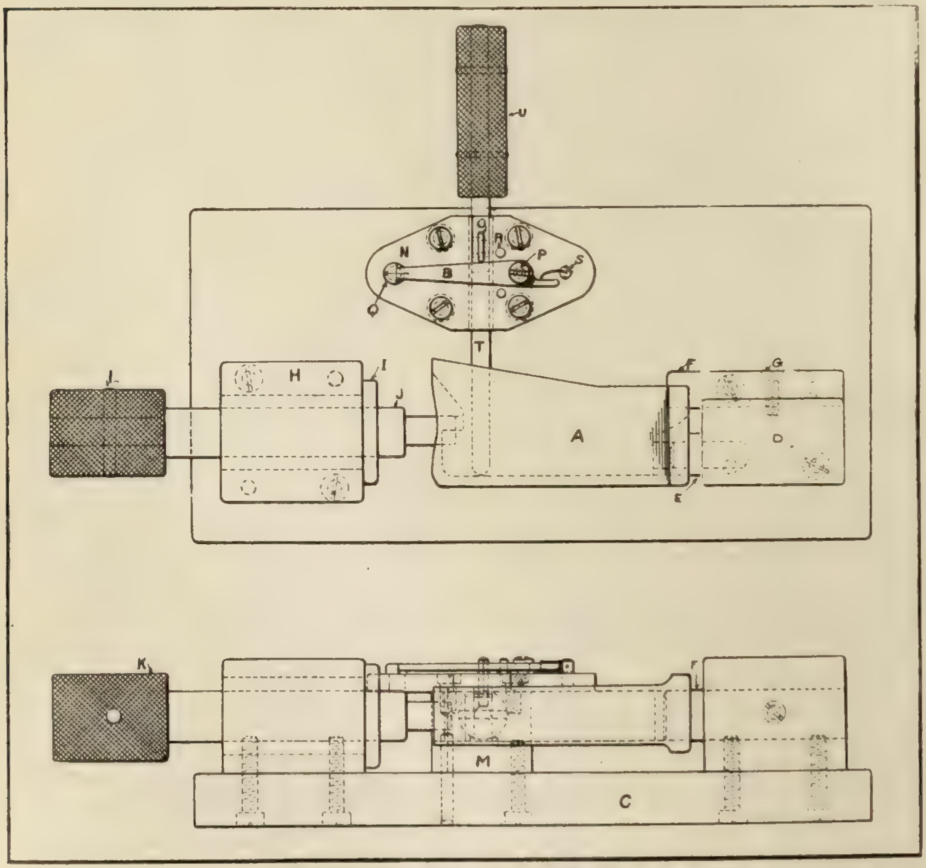
On the left hand side of the plate another machinery steel block (H) is held in position with two fillister screws and two dowel pins, and in its centre is bored a 1⅜ in. hole, to receive as a driving fit, the hardened, ground and lapped tool-steel bushing (I). In this bushing is fitted a hardened, ground and lapped tool-steel plug (J) with a turning fit in the receiver (A) hole. On the other end of the plug is fitted a knurled handle (K) held in position with a pin (L). When this block is properly located, it should register parallel with the other block, also parallel with the cast iron plate as regards the inside cut in the receiver.

Multiple Mechanism.

The multiple mechanism consists of a hardened machinery block (M) held on the cast iron plate by two screws and two dowel pins from underneath the plate. In the centre of this block is milled a 5-16 in. clot, ⅞ in. deep or the same depth as the width of the cut in the receiver. In the bottom of this slot is cut a T groove, to enable the sides in the slot to be lapped thoroughly clean and parallel in a lapping machine or a hand-miller, because this sliding gauge has to fit exactly the same as a hardened, ground and lapped plug gauge. Should there be the least play on the sides, it will show immediately on the multiple lever.

Lapping Feature.

Perhaps some readers are interested in this lapping proposition, therefore, to that end I will endeavor to explain it in detail. Procure a cast iron disk ¼ in. x 3 in. with a ½ in. or 1 in. hole to fit the arbor of a hand miller, and take a side tool and place it in the hand milling machine vise. Turn the vise over on an angle of about 15 degs., with the side tool on the centre line of the cast iron disk. Face off both sides and relieve it so as to give the disk about ⅛ in. surface, bearing on the sides. This is done in order to have the disk run absolutely true on the arbor. Now replace the side tool with the block (M) and adjust the vise so that the disk bears all the way on the side. Mix thoroughly, fine emery and sperm oil together with a few drops of kerosine oil. Run the hand miller on the first speed and move the disk over until it just begins to touch the sides. Stop the machine and apply freely the mixed emery. Move the vise inwards one-thousandth of an inch and start lapping by moving the handle to and fro until the sides are thoroughly clean on both sides. With this method we are now sure the sides are absolutely parallel



INSPECTOR BENCH GAUGE.

both ways, up and down, and also lengthwise.

On top of this block is located a plate (N) with four fillister screws. One side is cut out to make room for the punch plate (O). In the centre on top of this plate is located the multipying hand (B). This hand is made to register 5-1 and is held on the plate with a turning fit on the shoulder screw (P) by a washer underneath. On the other end is marked the zero line which matches a similar line on the shoulder pin (Q). This is made the same height as the multiplying hand, and is driven into the plate. On each side of the multiplying hand two stop pins (R) are driven into the plate to prevent the spring from breaking. On the side of the multiplying hand in the plate is driven another shoulder pin(S). This is slotted on top in the middle for a flat spring .020 inch thick, which is held with a pin. The spring keeps the muliplying hand away from the work. The sliding 5-16 in. x ⅞ in. gauge (T) is made of tool steel and hardened, ground and lapped to a perfect sliding fit in the block (M), and the point is beveled off so as to give only 1-16 in. bearing surface. The other end is turned 5-16 in. diameter to a driving fit in the knurled handle (U), and held in place with two dowel pins.

To manipulate this gauge, place the receiver (A) in the stop plug (E), located by stud (F). Push in the plug (J) and the sliding plug (T) until it stops. It can there be seen at a glance if the bottom is correct.

MACHINING A LARGE CASTING ON A SMALL PLANER.

By H. P. Dodge.

In a general jobbing shop it was required to finish both ends of a box casting about 10 feet long, 26 inches wide and 20 inches deep. As there was no planer in the shop large enough to take the job, it was necessary to rig up a temporary arrangement as shown in the accompanying photograph. The tool head was removed from the planer and an extension in the form of a flanged cylinder was bolted to the cross slide. To the end of this projection was bolted the tool head, thus locating the tool about 30 inches in advance of the housings.

One end of the casting was laid on the platen of the planer, crosswise, and the other end was supported by a chain sling carried on a trolley rigged up to run on an I beam supported by two trusses or horses as shown. The I beam was shimmed up until perfectly level, and when the planer was started, the trolley rolled back and forth along the I beam, supporting the outer end of the casting, while the other end was carried back and forth by the platen of the planer. This expedient worked satisfactorily for the particular job.

MACHINING A LARGE CASTING ON A SMALL PLANER.

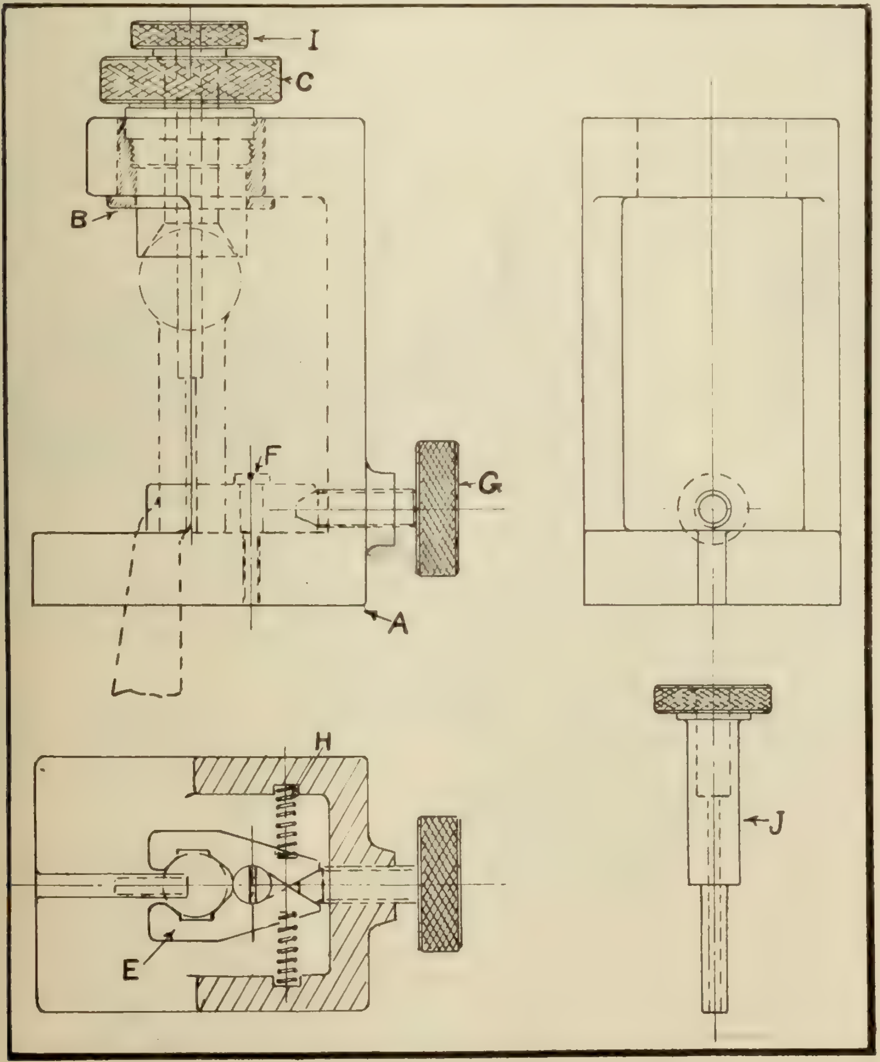
DRILLING BALL HAND LEVERS.

By H. R.

The sketch illustrates a jig for drilling the ball end of a ratchet change speed lever. It will be noted that same was a difficult job, on account of the lenghts of the holes.

The jig consists of the casting (A), which forms the main body. Into this is fitted the hardened steel screwed bushing (B). This accommodates the screwed bush (C), which has a conical end, so that when screwed down, same will position the ball end of the lever. Fitted to the base of the casting (A) is a pair of small levers (E). These have Vee's cut in them, so as to centralize the lever to be drilled. The levers (E) being pivoted on the fulcrum (F), by adjusting the knurled screw (G) a suitable grip on the lever is maintained. It will be readily seen that when the screw (G) is loosened, the coiled springs (H) release the grip of the levers (E).

The larger hole is drilled first in the drill bush (I) shown in the jig, and the smaller hole is drilled from the bush (J). In order that the hole shall not run out of truth, the drill bush (J) pilots into the hole which is first drilled.



DRILLING BALL HAND LEVERS.

DEVELOPMENTS IN MACHINERY

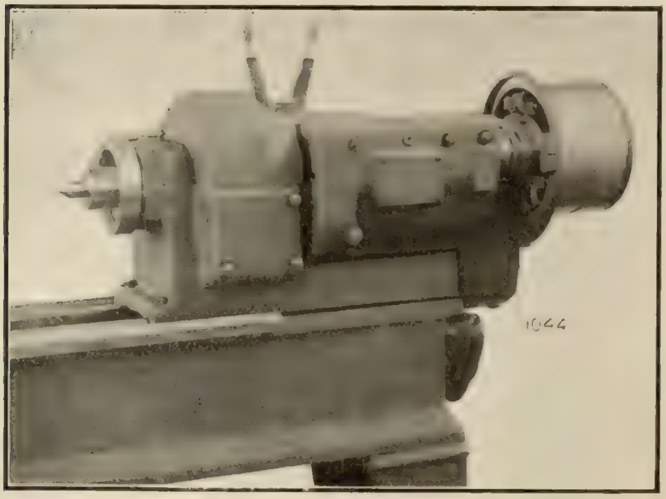
A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

LODGE & SHIPLEY "SELECTIVE HEAD" LATHE.

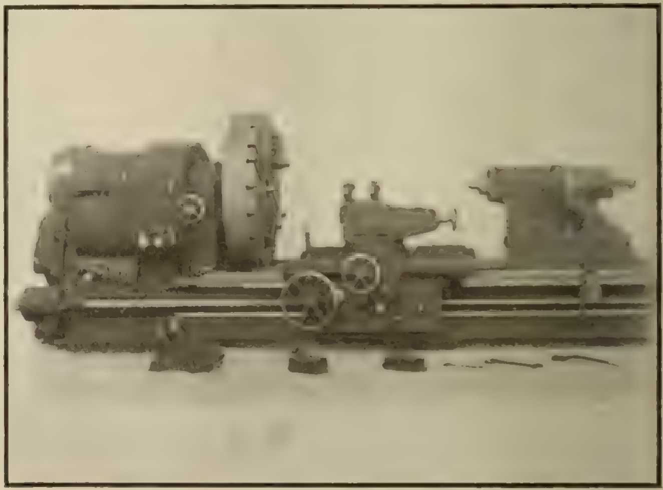
TO combine strength, simplicity and durability, the selective type automobile transmission has been adopted for the gear box drive of the new Lodge & Shipley "Selective Head" Lathe; this permits any one of the spindle speeds to be selected instantly—hence the name.

A constant speed single driving pulley running at a high belt velocity delivers an excess of power to the cutting tool under all conditions. As the diameter of the work increases, the gear ratios and the torque proportionately increase; thus, lathe work requiring a maximum amount of power can most advantageously be handled.

Power is transmitted through hardened steel gears mounted on shafts running in ball bearings. This eliminates the great frictional loss in journals and by soft gear teeth common to many types of single pully heads. As the result of these and other refinements, the "Selective Head" attains an exceptionally high mechanical efficiency. Wear of gear teeth and of bearings is reduced to a minimum, making it possible to produce nicely finished work free from gear marks.



REAR VIEW OF "SELECTIVE HEAD."



48 IN. "SELECTIVE HEAD" LATHE.

Headstock Casting.

The headstock is made of box section, with the sides extended up to the center line of the spindle, making this an unusually rigid casting. Further stiffness is added by the internal bracing with both longitudinal and cross ribs. The back of the headstock is planed to receive the gear box, which is made as a separate unit. Covers totally enclose all gearing

Spindle Speeds.

There are 6 speed changes in the gear box, from which the drive is either direct to the spindle or through shifting back gears in the headstock proper, giving 12 spindle speeds in all back geared lathes from 14 in. to 27 in. inclusive. The 30 in. and 36 in. lathes can be provided with triple gearing when so ordered; this gives 18 speeds. These two sizes are also furnished without triple gearing; they then have 12 changes of spindle speed. In the triple geared lathe, there are 6 speed changes by direct drive from the gear box; another 6 changes through the back gears, and the third set of the slowest 6 speeds is obtained through the triple gearing driving into the internal gear of the face plate. On the 42 in. and 48 in. machines, the triple gearing is always supplied in order to get the speeds sufficiently low to accommodate the large diameters.

Friction Pulley.

An extended flanged hub attached to the gear box carries the driving pulley, and thus relieves the driving shaft of all belt pull. Inside the pulley are two frictions, one of which drives the initial shaft direct, while the other drives it at a back geared speed. The friction is at the initial point only, to insure a powerful drive, and the friction will easily slip the belt. The ratio of the direct speed to the back-geared speed is about 2.6 to 1. This is approximately the ratio between the finishing and roughing speeds on a given diameter of work; therefore, in order to increase the speed from a roughing to a finishing cut, the gear shift does not have to be made, it being only necessary to shift the friction lever from one side to the other. The friction pulley is entirely enclosed at its outer and to retain the oil for the friction surfaces. A combination oil and belt guard is provided at the inner edge to prevent throwing oil on the belt.

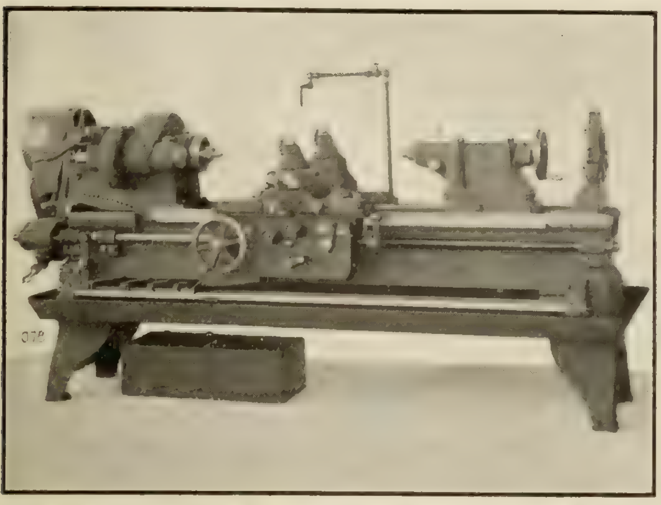
Transmission Gears.

All gears within the gear box are of the stub tooth 20 degree pressure angle type. They are made from chrome nickel steel, heat-treated and hardened. After hardening, the bores of the gears are ground concentric with the pitch circles, and finally the gears are mounted on an arbor in a special machine where the teeth are lapped, so that any distortions due to the hardening are removed. This insures perfectly true gears, easy rolling action and noiseless operation.

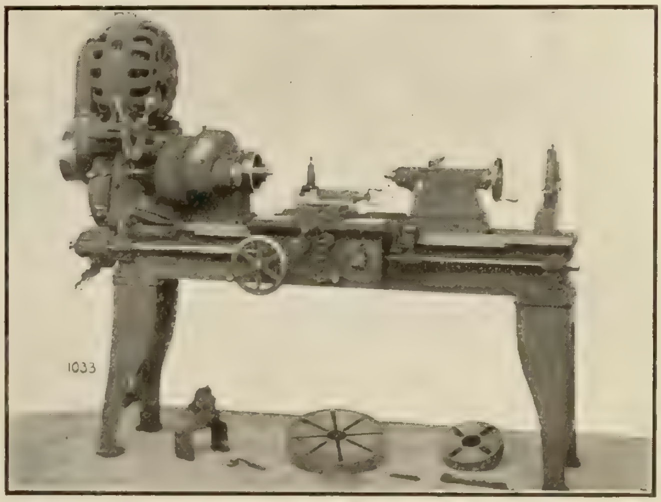
Gear Box.

The entire speed changing mechanism, except the back gears of the headstock proper, is contained in the gear box, which is an independent unit tongued and bolted to the back of the headstock. It may be removed at any time without affecting the other parts of the head, or without removing the motor in the case of a motor drive.

The gear box is oil tight and dust-proof. The gears run at all times partly submerged in oil. The initial shaft of the gear box, which has either direct or back geared speed, transmits power to the driven shaft through sliding gears. There are 3 speed changes to the driven shaft by these sliding gears, which, with the 2 speeds of the initial shaft, give 6 changes of speed obtained within the gear box. The initial shaft in the gear box which receives the sliding gears has its four keys formed upon it. There are no screws or cotter pins inside the gear box, nor other small parts which might work loose and get into the running gears.



18 IN. BELT DRIVEN "SELECTIVE HEAD" LATHE WITH MANUFACTURING EQUIPMENT OF MULTIPLE STOPS FOR LENGTH AND CROSS FEEDS, PAN, PUMP, TUBING AND CONNECTED COMPOUND AND PLAIN RESTS.



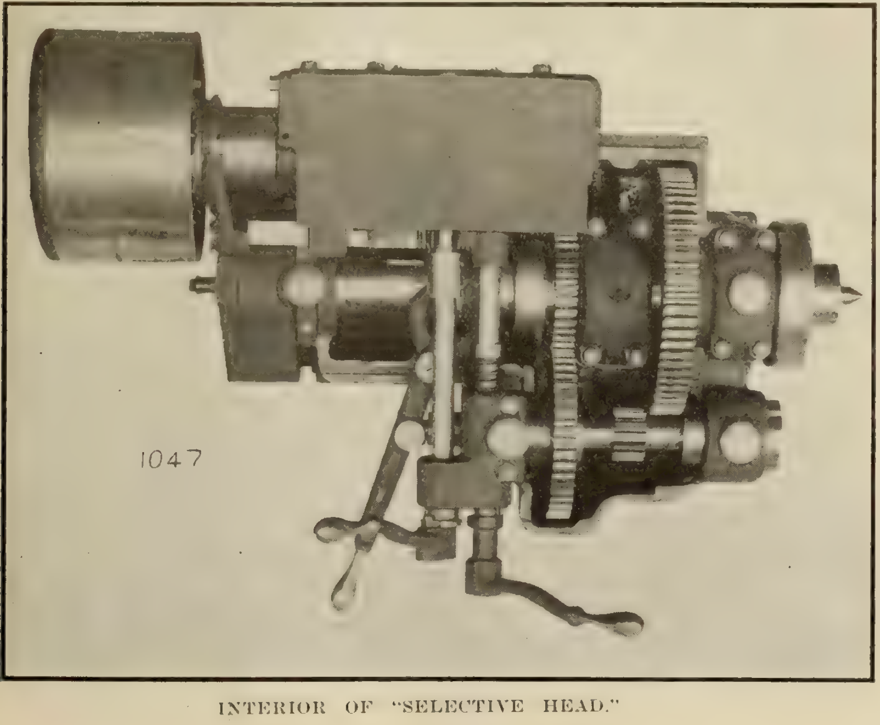
14 IN. MOTOR DRIVEN "SELECTIVE HEAD" LATHE. CONSTANT SPEED MOTOR IS MOUNTED ON THE HEAD AND DIRECT CONNECTED THROUGH SPUR GEARS.

Ball Bearings.

Both shafts in the gear box in all sizes of lathes are mounted in anti-friction ball bearings. Threaded dust plates retain the ball bearings in their respective seats, and prevent the admittance of dirt or grit to either the ball bearings or the gear box. No shaft runs at a higher rate of speed, even in the small lathes, than 375 R. P. M. This comparatively low rate of speed and the anti-friction properties of the ball bearings help maintain an exceptionally high efficiency of transmission.

Speed Control.

The 6 speeds provided by the gear box are obtained through two vertical levers, conveniently located on the front of the headstock. The lever nearest the operator controls the two frictions in the driving pulley, and stops, starts and gives fast and slow speeds by moving the lever to the right or left. The other vertical lever shifts the gears, and must be moved to the right or left, and also in or out, to select the required gear. The horizontal lever operates both a positive stopped clutch on the spindle, and the sliding back gear pinion which is interlocked with the clutch so that both cannot be engaged at the same time. A plate on the front of the headstock gives a complete list of all speeds and position of levers for obtaining them.



INTERIOR OF "SELECTIVE HEAD."

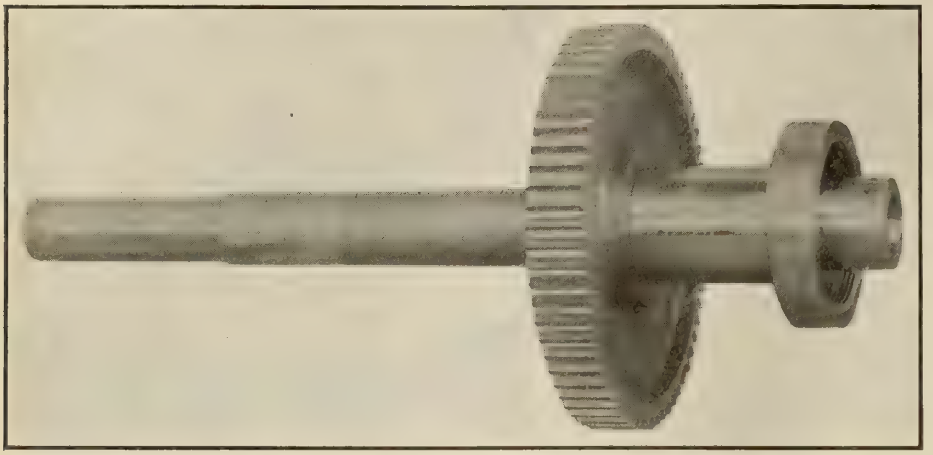
Back Gears and Triple Gears.

The back gearing is located at the front of the headstock. The back gear shaft and pinion in lathes from 14 in. to 36 in. sizes both inclusive, are cut from a single steel forging. The teeth of the pinion are hardened. The shaft is journalled in continuously lubricated bronze bushings. The triple gear is operated by a hand wheel which slides the triple gear pinion into or out of mesh with the internal face gear. All headstock driving gears are of steel, and as previously explained, gears subjected to the most wear are of chrome nickel steel heat-treated and hardened. On all lathes the gearing is designed to give practically uniform speed progression throughout the entire speed range.

Spindle and Spindle Bearings.

The spindle is of large diameter and made from chrome nickel steel. The end thrust is taken against the rear housing by alternate bronze and hardened steel thrust washers. The spindle bearings are of special composition white metal, renewable and interchangeable, and are continuously lubricated by wick oilers from large oil wells. These white metal bearings are faced and turned in halves to exact gauge size; the headstock casting being reamed to this same size. The screw holes are drilled by jig.

Spindle Nose.



SPINDLE AND FACE GEAR FROM "SELECTIVE HEAD" LATHE, SHOWING NEW TYPE SPINDLE NOSE.

The spindle has a double nose, consisting of an inner cylindrical portion and an outer cup. The cup is threaded internally to hold the chuck plate in position, and the end is faced to provide a very large diameter shoulder against which the face plate is tightened. The inner cylindrical portion of the nose is left blank, and extends beyond the outer nose, so as to form a pilot to receive the face plate or chuck plate. This pilot at all times accurately centers the chuck plate, and, by centering the bore of the chuck plate before the threaded portion is reached, insures that the threads engage easily, and that the chuck plate may be readily drawn squarely against the face of the outer nose. It is a comparatively easy matter to accurately fit a chuck plate to this spindle, as the bore may be reamed standard size to fit the pilot, and the thread is used only to hold the plate in position against the face of the cup. The threading of the chuck plate is easily done, as it is a job of external chasing. The large diameter of the shoulder afforded by the cup prevents the face plate becoming stuck to the spindle nose, and makes it always an easy matter to remove the face plate or chuck.

Spindle noses of "Selective Head" lathes from 14 in. to 20 in. inclusive are made to the same standard, so that chucks will interchange from one lathe to another between these sizes. Similarly, another standard is used for all lathes from 22 in. to 36 in. As the larger lathes are triple geared, there are but the two sizes of spindle noses for the entire range of lathes.

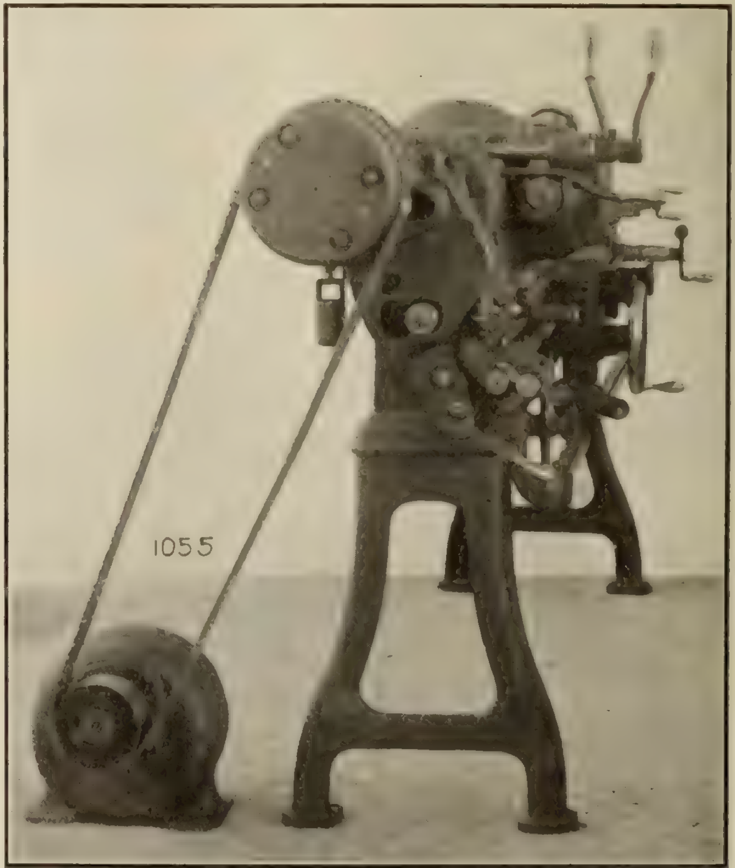
No countershaft is necessary with this lathe, if the machine can be placed near the line shaft, and the drive may be either with straight or quarter turn belt. If a countershaft is required, either a single speed plain tight and loose pulley counter shaft or a double friction countershaft may be furnished.

Motor Drives.

Any standard make of motor, either direct or alternating current, constant or variable speed, within reasonable limits of size and speed can be mounted on the top of the headstock and direct connected through gearing, a gear which contains the same friction mechanism as the pulley, being substituted for the pulley at the end of the gear box. A suitable casting is mounted at the end of the headstock cover, and carries on intermediate fibre gear running in positively lubricated journals. This casting serves as a gear guard and cover for all of the motor drive gears. A pinion on the armature shaft meshes with the intermediate fibre gear, thus giving a direct drive to the gear box of the headstock. The user may at any time drive a regular belt driven "selective Head" lathe from an individual motor placed on the ceiling, or on the floor, and direct connected to the head stock pulley by a belt, constituting the "simplicity" motor drive. A constant speed motor is generally used for this style of drive.

Lathe Details.

The bed is made from close grain iron of high tensile strength, and the top is cast against a chill which makes it very hard and dense, and greatly increases the life in alignment. The chill so closes the pores of the iron that dirt and grit cannot become imbedded in the ways to wear the carriage by a lapping action. The tail stock has floating binders to insure correct alignment of the tail stock spindle. Clamping bolts for holding the tail stock to the bed are operated from the top of the barrel. In 22 in. lathes and larger, a pawl on the base of the tail stock engages the rack in the center rib of the bed, to afford a positive brace. The quick change gears for feeds and threads are of drop



16 IN. "SELECTIVE HEAD" LATHE WITH "SIMPLICITY" MOTOR DRIVE. MOTOR IS PLACED ON FLOOR AND BELTED DIRECT TO THE REGULAR DRIVING PULLEY.

forged steel, located beneath the headstock, and firmly supported in the walls of the bed. Changes of feed or thread can be quickly made while the lathe is under cut.

The carriage is gibbed inside and out, has oil trough around the front and rear wings, and the extra wide bridge takes a supplementary scraped bearing against the inside horizontal and vertical flat surfaces of the bed, thus providing a positive support directly in line with the tool thrust. The compound rest has a special square base so designed that the top slide cannot be overhung, which provides a solid metal-to-metal anvil support under the tool to prevent any vibration. The apron is self contained and double walled with studs supported front and rear. All gearing except the frictions is of steel, and a stub tooth rack pinion insures greater strength. Manufacturing equipment consisting of multiple stops for length and cross feeds, connected compound and plain rests, pan pump and tubing, and a fourway tool block can be furnished with any of these lathes. These are valuable additional appliances for turning repetition work.

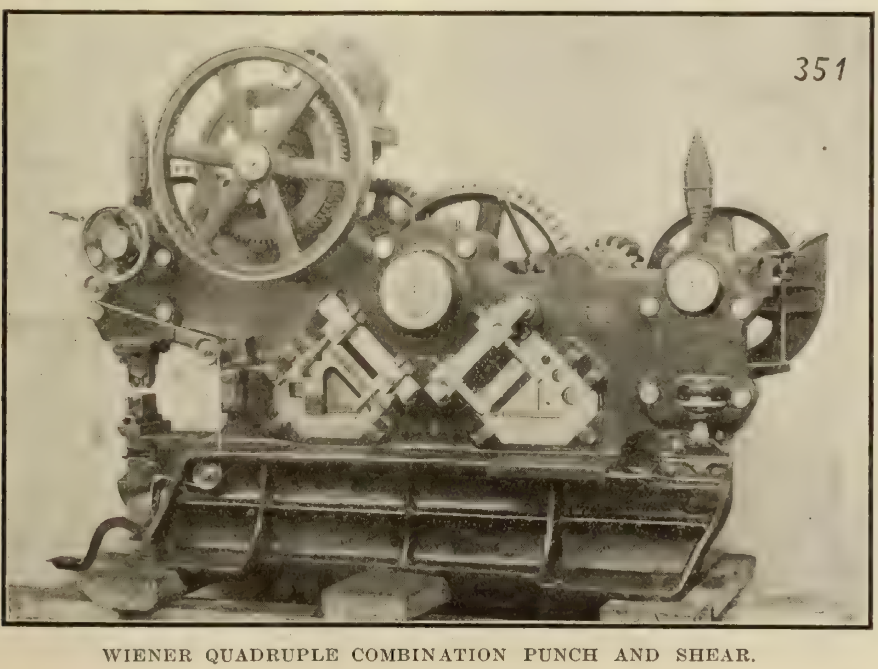
The Lodge & Shipley Machine Tool Co., Cincinnati, Ohio, are the builders of the foregoing specialties.

QUADRUPLE COMBINATION PUNCH AND SHEAR.

THE Wiener Machinery Co., New York, as managers of the Oeking Co., have placed on the market a Quadruple Combination Machine, of the "imperator" type, which is illustrated herewith. The design is the result of the success achieved by the Oeking solid steel frame triple combination machines, and of many inquiries received for a combination machine which could miter angles, right and left, without changing knives. It was also found that a market existed for machines which, besides cutting and mitering angles, rounds and squares, would cut beams and chanels.

There are contained in one frame, ready for work, all the tools for almost any kind of cutting, shearing, coping, mitering and notching. The frame, being one massive piece of steel, permits a compactness which makes the machine most suitable and economical for crowded shops. It recommends itself also for plants where driving power is limited. The "Imperator" machine will, without change of tools, split plates of unlimited length; cut flat bars; shear off rounds and squares; cut and miter angles and tees, right and left, and punch plates and structural material, both webs and flanges.

With interchangeable tooks, beams and channels, or any other shape can be cut, while the punching tools can be interchanged for coping, mitering, etc. The machines are built in three sizes, and can be furnished with tight and loose pulleys for belt drive, arranged for direct motor drive, or if so desired, can be mounted on a turntable, to facilitate mitering long angle irons. The cost of the Combination Machine is claimed to be no more than that of the equivalent single machines, while being much more economical in operation.



WIENER QUADRUPLE COMBINATION PUNCH AND SHEAR.

CANADIAN CAR AND FOUNDRY.

WORK on the various plants of the Canadian Car and Foundry Co. is proceeding apace. The new steel car plant at Amherst, N.S., is fast nearing completion, and will be turning out its full complement of 20 cars a day some time this month. This plant is built on the very latest model, and is capable of turning out either all steel or composite cars.

The addition to the rolling mill consists of another 18-inch mill, driven by a 750 h.p. engine. The building is 100 by 200 feet, and the department is now in operation. A department is being added for the manufacture of springs, the space required being 80 feet square. The machinery has been ordered which, when installed, will enable the firm to make springs for car building and other purposes. The necessary motors have already been obtained.

The largest recent addition is the new shop for making bolsters, steel cars and fabricating structural steel for building. This shop is 180x500 feet. The construction is steel frame, concrete and hollow tile walls. About 600 h.p. will be required to operate these shops, and practically all equipment has been purchased.

Progress on the Fort William plant is very satisfactory. The Dominion Bridge Co. has made good headway, and already has completed steel work for over 500 feet on both of the main aisles; and, in addition, has made good progress on power house structure. Over 120 men are working on the buildings and plant. The figures furnished above show that about 50 per cent. of the car plant is already erected.

Extensions which practically double capacity of the Brantford plants, are now completed. These cost over $150,000. The net result is that these plants, formerly known as Pratt and Letchworth, have doubled their output.

Though exact figures are not available, it is known that the company has already to its credit larger profits than this time a year ago. Increase in sales has been large, and a sufficient volume of new business is on the books of the company to warrant a large further increase before the end of the year. A proportionate amount of this, of course, represents increased profits. Geo. T. Douglas is manager of the car works.

JAR RAM STRIPPING MACHINE.

A NEW and useful jar ram stripping machine has been developed and placed on the market by the Herman Pneumatic Machine Co., Zelienople, Pa. The purpose of this product is to meet the need of a jarring machine to handle flasks that are not large, yet comparatively deep. There are many types of hand ram stripping plate machines now on the market, but as the advantages of the jar ram method are so well known, it is not necessary to rehearse same here.

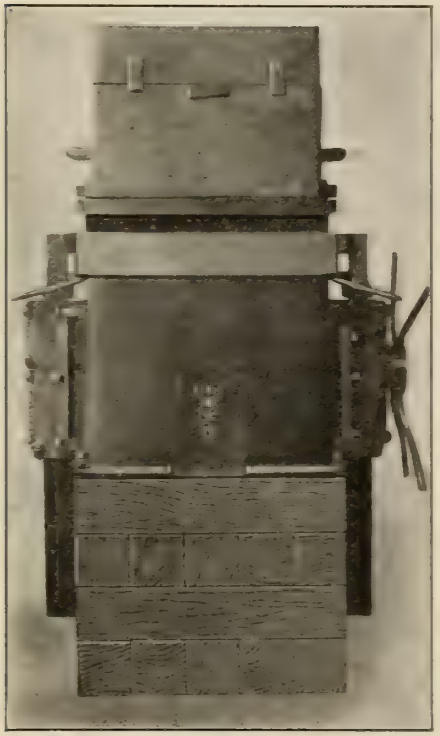

FIG. 1—FLASKS AND STRIPPING PLATE RESTING ON TABLE PLATE.

Fig. 1 shows the flask in place, rammed up by the jarring method. Fig. 2 shows the flask stripped off pattern, the pattern itself being fastened to the pattern plate, which in turn fastened securely to the table plate. The stripping plate surrounds the pattern and rests on suitable raised strips on the pattern plate. Fig. 3 shows the mold removed from the machine, and stripping plate let down over the pattern ready to make another mold. Fig. 4 is a side view showing the exterior construction of the machine, and also the manner in which the stripping plate is ribbed in order to conform with the ribs on the pattern plate. The pawl used for locking the stripping mechanism at any desired height is also shown.

This jar ram stripping machine consists of a cast iron base, having an equaly distributed resilient jarring surfaces, the table plate and plunger being of cast steel, in one piece, with cast iron packing rings. The oiling system for the plunger and cylinder is within the first named, where a storage reservoir provides sufficient oil to insure lubrication to cylinder and plunger for some time. The control valve is a Herman automatic sand proof mechanism, and is applied to all machines of their make. The stripping mechanism is formed of two steel racks, one on each side of machine, and steel gears meshing in the rack, both accurately machined. These gears are securely fastened to a shaft passing through the machine, insuring both racks raising together. The aforesaid shaft has four sand proof bearings, and the stripping rack has a long adjustable babbitted bearing, which allows for taking up lost motion caused by the rack running in its bearing.

The ratio of leverage between the handles of the gear is about 6 to 1, therefore, a flask weighing from 200 to 300 pounds can be stripped with very little exertion on the part of the operator. All moving surfaces and bearings are fully protected from sand, and have the latest design of spring oilers to which easy access is assured. Very little foundation is required for this machine, same being formed of timbers and a small amount of concrete.

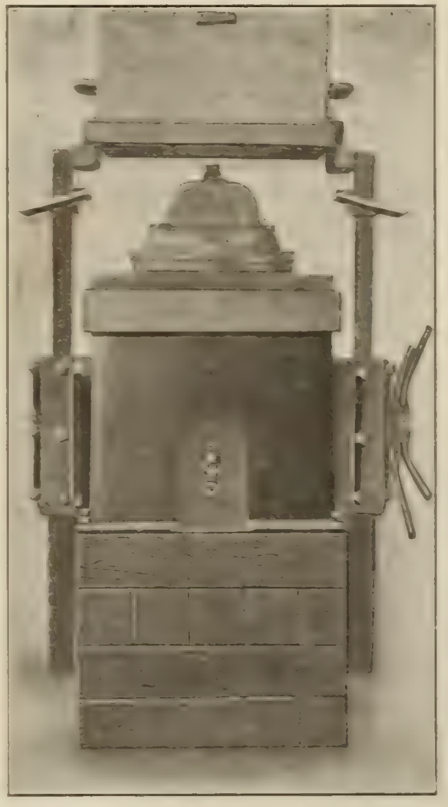

FIG. 2—MOLD STRIPPED OFF PATTERN.

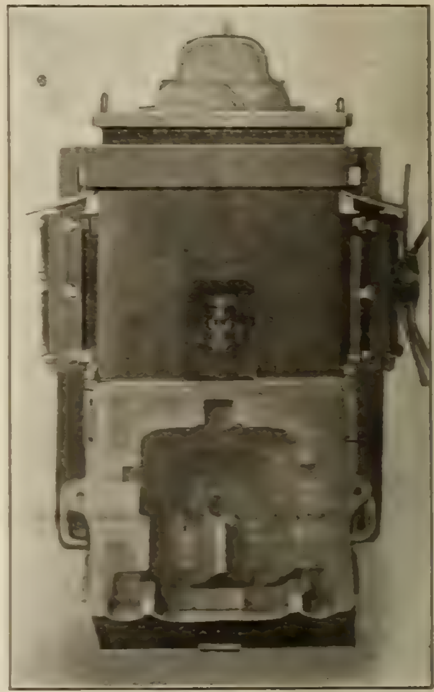

FIG. 3—MOLD REMOVED AND STRIPPING PLATE IN POSITION FOR MAKING ANOTHER MOLD.

The size table plate shown in the illustrations is 16½ in. x 18 in., with 12 in. draw.

◆

PATTERN SHOP AND FOUNDRY.

IN the course of a paper read before the St. Louis Branch of the Associated Foundry Foremen, Mr. William Hommel, the author said:

"That up-to-date pattern shops should be equipped with the best possible machinery obtainable, and the various tools should be so arranged that the patternmaker will lose the least possible time in walking from one machine to the other. For example, the cut-off or band saw should be close to the lumber rack, and the rip saw, jointer and surface planer should follow in the order named. The best possible material should be purchased for making patterns, which include lumber, shellac, glue, etc. For all rough work and one or two casting jobs, an inferior grade of lumber should be kept in stock. Also, many patterns can be made in plaster and wax that would require much more time to produce in wood. This applies principally to patterns for architectural work.

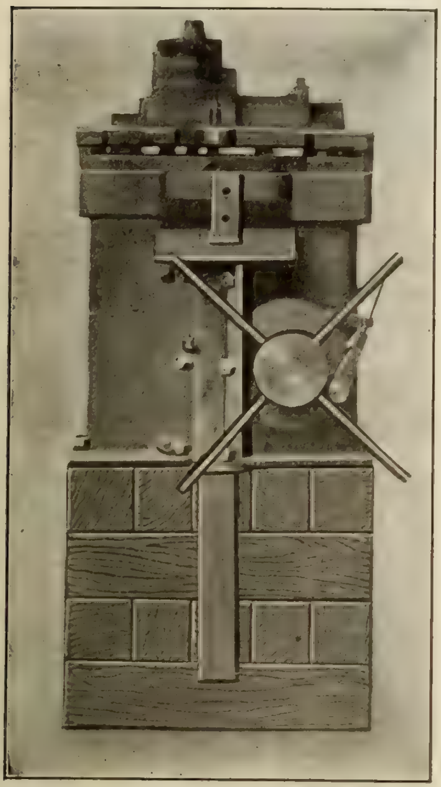

FIG. 4.—SIDE VIEW OF COMBINATION JAR AND STRIPPING PLATE MACHINE.

"When the word harmony is applied to the relations existing between the pattern shop and foundry, it follows that there is a minimum of friction between the two departments, and a maximum of output. The patternmaker should not slight his part of the work, thereby causing trouble for the molder, and, on the other hand, the molder should not expect the patternmaker to devote unnecessary time to a pattern which can be satisfactorily molded with a little extra care on the part of the molder. Frequent consultations between the patternmaker and the foundry foreman will result in avoiding much unpleasantness.

A conscientious patternmaker usually will endeavor to make a pattern to meet the requirements of the molder. However, care should be exercised in handling patterns, as it seems that frequently a sledge hammer is employed for rapping. Another great fault I find is the way many molders use their swabs. A wood pattern, regardless of the number of coats of shellac applied, will soon warp as a result of the too liberal use of the swab.

"The cost of the castings should always be carefully considered by the foremen of both departments."

◆

GASOLINE ENGINE PISTON MOLDING MACHINE.

FOR molding gasoline engine pistons the Arcade Mfg. Co., Freeport, Ill., has recently designed special pattern equipment which may be fitted to its standard type molding machine without alteration of the essential features of the latter. The attachments, which include a split drag pattern and a cope stripping plate, were developed primarily to meet the requirements of the Ford Motor Co., Detroit.

The Ford plant is operating this year with an output of 800 cars daily, requiring 3,200 pistons. In addition, a large number of extra pistons are manufactured and shipped to branch houses carrying stocks of spare parts, together with quantities of special oversize pistons, which are used to replace standard pistons in cylinders that have become worn by use. In other words, the Ford Co. is casting about 300 tons of pistons per month, this being equal to the total output of many foundries of respectable size.

When made by hand on plain stripping plate machines, using dry sand cores, and allowing an output of 200 pistons per man, a gang of from 30 to 35 men was required, including core labor. With the Arcade machine four pistons are made in a flask and a daily output of 150 flasks per man is expected. The core room work will be eliminated, and the labor in the piston department reduced to one-fourth or one-fifth the amount necessary when using dry sand cores.

The pattern plates are mounted on the revolving table of the machine, and fig. 1 shows the patterns in position ready to receive the cope and drag flasks. The drag pattern at the left contains split cup sections, which are controlled by the linkwork (L). When the ramming operation is completed, the split cups separate, thus releasing the sand contained in the green sand cores. The cope pattern is simply a plain stripping plate which permits the mold to be made without draft.

In operating the machine, the flasks are placed on the pattern plates when they occupy the position shown in fig. 1, the sand being thrown in, the surplus scraped off, and the cope and bottom boards clamped in place. The table is next rolled over, the mold pressed, and the patterns drawn in the customary manner. Drag and cope halves of the mold are shown in fig. 2. Of course, before the pattern plates are lifted, the lever controlling the linkwork connected to the split cup patterns is shifted, re-

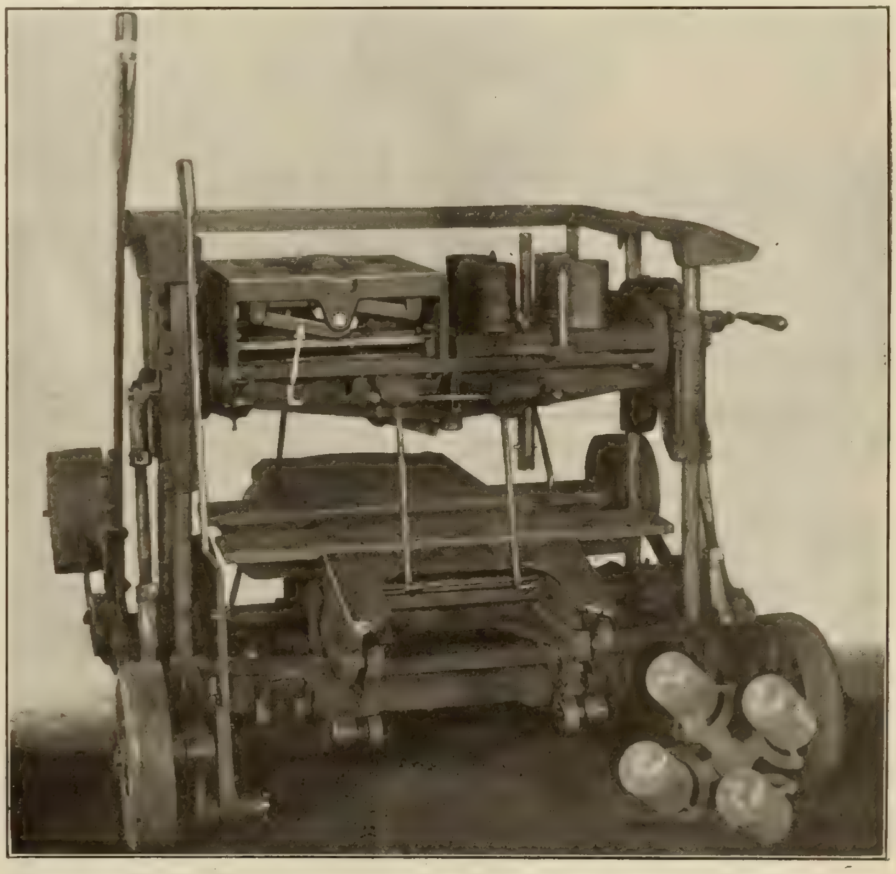

FIG. 1.—ARCADE PISTON MOLDING MACHINE.

leasing the cores. The wrist pin bosses and reinforcing rings are all made in the core. When the patterns are drawn, the drag rests right side up on the platen of the machine with the green sand cores extending upward.

All that is necessary to complete the mold is to place the cope in position over the drag and set the flask onto the floor. The long lever at the left of the machine is used in drawing the patterns, and the clamps holding the cope and bottom boards are automatically released. The machine is also equipped with a pneumatic vibrator and automatic trip for vibrating the pattern. Being on wheels, the machine may be moved along the pile of sand as the operator makes up his floor, thus reducing the amount of walking to a minimum.

The metal is poured through a single central runner which connects with a cross gate in the drag. The iron rises in the mold from the bottom, insuring sound, dense castings. The details of the gate and runner are clearly indicated by the castings shown in the lower right hand corner of each illustration.

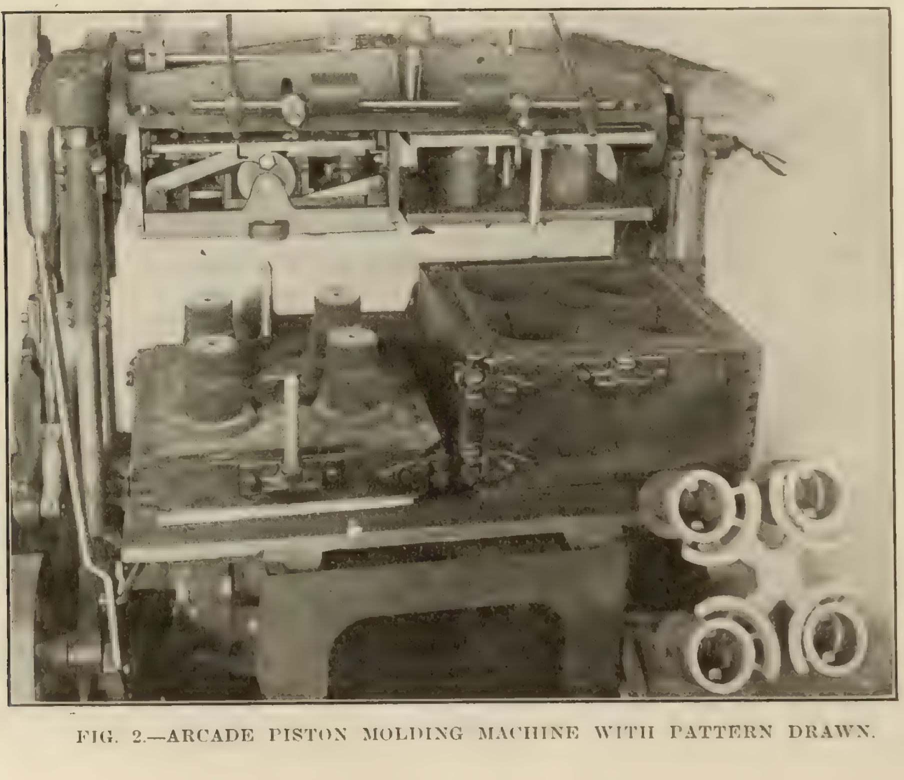

FIG. 2.—ARCADE PISTON MOLDING MACHINE WITH PATTERN DRAWN.

FOUNDRY ELEVATOR GUARDING.

WILLIAM H. DOOLITTLE, Safety Inspector of the National Metal Trades Association, writes to "The Review" on the subject of "Foundry Elevator Guarding," as follows:

"In all foundries where the cupola charging floor is above the level of the yard, it is necessary to provide some means of getting iron, coke and other materials up to the charging floor. The device used most commonly for this purpose is the elevator. The material is loaded on trucks or barrows, run onto the elevator platform at the yard level, and by it raised to the required height. The elevator is usually operated by the laborer who brings to the cupola the load of material. There is, therefore, considerable danger of these unskilled workmen being injured by the elevator, and very careful guarding is desirable.

"There should be strong gates at both floors, which should be automatic in action, and maintained in perfect working condition. No workman should ever be allowed to fasten either gate in its high position, since, by doing so, the entrance to the elevator shaft is left unprotected and some one may enter it, and be injured. The lower gate should either be so high that a man may not put his head over it, or so low, that in event of his doing so, he will not be caught by the descending platform. The upper gate should be extended to the floor, preventing material dropping from the charging platform on the heads of workmen below. If there is not sufficient movement of the gate to allow this being done, a heavy wire screen may be installed, which covers the cage, and protects men who are riding, from falling material.

"If the elevator is lifted by cables there should be upper and lower limit stops attached to the mechanism independent of those on the operating rope, and they should be frequently inspected and carefully adjusted. The safety gripping device should be kept in perfect order so that it will act instantly in case of the breakage of the cables or failure of the hoisting machinery. Counterweights, if in the elevator shaft, should be enclosed, and that part of the platform adjacent to the counterweight screened. The lower sides of floor joists, beams and all other projections in the elevator shaft should be beveled or slanted, so that material or men may not be caught between these projections and the platform of the elevator. The slant should be long and gradual.

"It is dangerous to raise truck loads of material on a foundry elevator without making provision against their rolling off. The wheels should be blocked by sprags or dogs or some other method used to prevent accidents from this source."

* * *

ZINC PRODUCTION.

THE production of zinc in Europe last year was 650,670 tons, or 27,750 tons more than in 1911. This increased production was arrived at as follows:—Belgium, 5,025 tons more; Silesia, 12,710 tons more; France and Spain, 7,815 tons more; Rhenish Prussia, 7,635 tons more; Great Britain, 9,570 tons less; Holland, 1,180 tons more; Austria and Italy, 2,685 tons more; Poland, 1,155 tons less; and Norway, 1,425 tons more. Zinc was also produced in the United States last year to the extent of 309,560 tons, showing an increase of 46,300 tons. The aggregate production of zinc throughout the world in 1912 was 962,490 tons, or 70,610 tons in excess of the corresponding output in 1911. The average price of rough zinc last year was $126.50 per ton, as compared with $121.00 per ton in 1911, showing an advance of $5.50 per ton.

SAFETY RULES.

IN a recent article, entitled "Safety Rules," the vice-president of the Efficiency Society suggests for the engine room and other parts of a plant the following:—

All injuries, no matter how slight, should receive proper medical attention.

Never remove or even touch a safety flag or ticket. The man who places it should always remove it.

Safety committees may have overlooked something; therefore, see for yourself that everything is safe.

Take notice of all danger signs, and see that no one disregards them.

Safety devices must be maintained and used as planned, or they are of little value .

Careful men are usually efficient; careless men are not. Use safety devices always. Don't take a chance.

THE FACTORY MOTIVE POWER SITUATION.

THE more or less frequent interruptions, which Ontario manufacturers have recently experienced through the failure of their electric power supply, have not been such as to inspire confidence in the all sufficiency and dependability of a motive power whose transmission from the source of generative to its place of application, involves long, exposed and apparently easily vulnerable lines.

The vision of harnessing Niagara until not a drop comes over the Falls, leaving a bare, steep cliff, is dangled in front of our imagination to help sound the death knell (?) of "power generation by fuel combustion," and all too much attention is being directed to coal and oil supply exhaustion, and under cover of it, opportunity taken to knock steam and internal combustion engines. It is altogether too obvious, this "drumming out" and "buying out" business. Power generation by fuel combustion is a serious competitor of both Hydro and Toronto Electric, and each has to come some to meet this competition. We are not seriously worrying as to when the supply of combustible peters out, but we do want now the cheapest and most dependable power with which to carry on our business. Glorifying this or that promoter, and knocking this or that opposition, are each uncalled for, and show weakness and bad taste; besides being unbeneficial generally.

It seems to be forgotten that power users are out for the power supply that will pay them best now, and on this ground only must any public utility corporation who cater to them be judged. Too much dependence and blind trust has been placed in the almightiness of one or two individuals connected with Hydro-Electric, with the result that industrial Ontario has been brought practically under obligation to it. Shut-downs in our factories are becoming of a more frequent and prolonged nature, and no self respecting management can afford to allow its business to be demoralized with impunity by any power corporation. There is broadest ignorance concerning cheap power, thanks to the importunate and persistent campaign propaganda in operation by those opposed to steam power and fuel combustion generation systems.

Much loose talk is being indulged in regarding the establishment of steam auxiliary plants by our supply corporations, and if one thing serves more than another to show how much our industries are at the mercy of incompetent power management, it is the connoiseur air adopted by men who could not distinguish between a motor and a roll of toilet paper. The auxiliary steam plant proposition, let us add, will be in no sense a cure-all, and is nothing more or less, than a bare-faced bluff. A year ago, Toronto Electric, when its troubles had reached "peak load," set about the auxiliary proposition, so as to protect their customers. How well they have succeeeded, everybody knows. Hydro-Electric a year ago, was "cock of the walk," and infallible; to-day it is panicky and its administration at sixes and sevens.

The works or factory power plant is more dependable than any source of power, where long transmission lines intervene, and we are rather of opinion that the overdue return to its own of the individual power plant is within measurable distance.

◆

SERIES OF ARTICLES ON SCREW CUTTING.

DUE to a typographical error in the notice appearing in our last week's issue, relative to a Series of Articles on "Screw Cutting," July 10 instead of July 17 was given as the commencement date.

We take the opportunity of repeating again for the benefit of a large section of our readers to whom such a series of Articles should appeal, that the writer is an expert mechanic, and has been accustomed to instruct students from the practical and easily intelligible standpoint. The attention of apprentices particularly, and all others who desire to acquire a knowledge of the art from the bottom up, is therefore directed to the forthcoming series.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, July 8, 1913.—One of the largest independent iron and steel operators said yesterday regarding the prospects for those industries that the outlook in his judgment is good. The mills for the most part are running full, and this situation is expected to continue in the next few months, by which time the crop results will have been determined and many questions now acting in restraint of business will have lost force. He then expects a revival of new orders on a large scale. Meantime, there is little or no demand for light steel rails, and stocks held are extremely moderate. The iron and steel trade is also expected to derive an impetus in the autumn from a relaxation in the international money markets which leading authorities now predict.

Pig Iron and Copper.

There has been a slight backward tendency in refined copper. In fact, the records show that since January there has been a steady decline. A slightly weaker undertone is reported in electrolytic copper, and this has been backed up by European messages. Industrial conditions have been blamed for the drop in copper, both here and abroad. The wire drawers, mills and founders seem to have acted independently owing to the deliveries in copious form which took place during the last few weeks. It is common talk amongst the knowing ones that the big melters will have to worry about the market before the middle of August. Pig iron is not any more active, and the same prices that were in vogue last week now rule. Merchant iron is reported to have had a big "killing" in the States, and most of it was sold to pipe works. This means that there have been big municipal undertakings, hence the big markets get the call. Lead was dull during the week, but well sustained, while tin has shown some falling off, with no sign of picking up. It seems as if the prices have been more or less artificial for some considerable time, and no one has been exactly sure as to what has been going on. The celebrations of the 4th July have been interfering with business in the big country to the South, and it is only natural that Canada should have a taste of the effect. Spelter, antimony and old metals are uninteresting.

Toronto, July 8, 1913.—The Canadian Fairbanks-Morse Co. are doing a rushing business in small pumping outfits for summer cottages, etc., being inundated with orders. There is also a good demand for small size oil engines. Other departments are only fairly busy. Inquiries made by Canadian Machinery among manufacturers of machine tools, boilermakers, etc., elicited replies that varied somewhat in character.

Manufacturers Confident.

One of the largest boilermakers in the country says: "We should pronounce the boiler business good; in fact, especially good in view of prevailing money conditions. Our operations have not been curtailed at all, and at present we have very nearly the amount of work ahead that we had a year and two years ago. Given a bountiful harvest that would inspire confidence, which is as important as money, we see no reason for the coming of a condition of affairs wherein the boiler business would experience any perceptible check." The same note of optimism is sounded by one of the largest tool steel firms in the Dominion. Their representative says:—"Generally speaking, business has been very good, our sales from one store for the first six months of this year being 60 per cent. in excess of those for the same period in 1912. Collections have been slow, and many customers request longer time to make payments. Larger consumers are buying only for immediate needs, and during the last few weeks the situation has been quieter than in the spring." A large Eastern concern says: "Business generally is dull, although we have just received an order that will keep us busy for the next four months." Makers of machine tools seem of the opinion that improved conditions will be delayed until the late fall or early in the new year. Most of them are keeping their staffs intact in the hope that the slackness is only temporary.

Pig Iron and Steel.

With the curtailment of business in machine tool and other machinery lines the demand for pig iron falls off. Canadian manufacturers have not lowered their prices, and business is quiet. The poor hay crop in the North, East and West has affected the trade in wire. The price of bale ties has advanced 10c per 100 lbs. Other lines remain the same. At the Canada works of the Steel Co. of Canada, Hamilton, where small goods are made, they are running a night shift. Building operations are fair, and prospects in this sphere look good for the fall, according to the way builders are figuring. The representative of a sheet metal concern reports that while specifications are not coming in so rapidly, he does not find business so very bad.

Metals.

Prices in the metal market remain stationary, and business done is nil. The old material market is weak. There was a reduction in the price of manufactured copper June 30, from 17½c to 17c. for bare copper, and from 18c to 17½c for copper cable, sizes ½ inch to No. 8.

◆

HALIFAX POWER CO. DEVELOPMENTS.

THE Halifax Power Co. is planning to develop two sites on the Indian River, 18 miles west of Halifax. The upper station will include two units of 1,200 k.v.a. each. One operates on 90 ft. head from the Indian River watershed, and the other on 160 ft. head from the North-East River watershed; the latter water is carried over to the Indian River by means of a long pipe line. The lower station will include two units of 1,200 k.v.a. operating on 90 ft. head; in this station the step-up transformers and high-tension gear will be placed.

These developments will render 5,600 h.p. available in Halifax, which will be carried over a duplicate transmission line by two separate routes. Transmission will be at 33,000 volts. It is the intention of the company to sell this power for lighting and industrial requirements in Halifax. Plans are well under way for the upper development, one transmission line and receiving station, and it is expected that this portion of the work will be proceeded with immediately.

NEW TUNNEL UNDER NIAGARA.

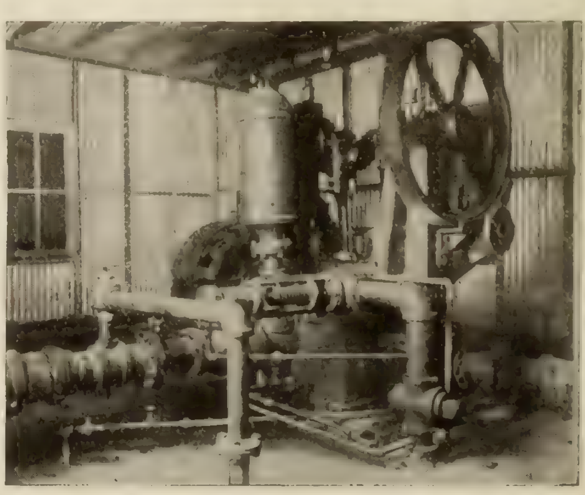
THE engineers of the Ontario Power Company are considering the construction of a tunnel under the bed of the Niagara River, just above the Horseshoe Falls, the object being to provide a new water course for their powerful turbines. At present the turbines are fed from two tunnels, each about 18 feet in diameter, but the ever-increasing demand for power has overtaxed these channels. They are located just under the ground surface, alongside of the street car tracks that go up to Chippewa, and experience has shown that it is not wise to duplicate this construction for future use. One is made of steel, overlaid with concrete, and the other is of reinforced concrete. These are subject to atmospheric changes, and it is on this account that the new location of the other tunnel has been chosen.

The beginning of the new pipe will be at the dam just out from the Dufferin Islands, and it will be carried almost to the brink of the Falls; then it will swing over to the Canadian side, and from here the water will reach the turbine house at the foot of the Falls.

◆

A PUMP WITHOUT AN ATTENDANT.

ONE of the important advantages of the electric motor for driving pumps is illustrated in the installation shown in the accompanying photograph. The pump is situated three miles from the power house it serves, and is started and stopped by an oil switch in the power house. No attendant ever goes near it except to give it a periodical inspection; hence its cost of operation is very low.



A PUMP WITHOUT AN ATTENDANT.

If desired, in such an installation, recording instruments can be placed in the power house to indicate how the pump is operating. Such instruments show whether the motor is running normally or not, and if the load is too high or too low, thereby giving notice when something is wrong. The power house attendant can, therefore, give the outfit almost as careful attention as a man on the spot could give. It is convincing testimony, as to the reliability of the motor-driven pump, that such an outfit can be operated for years without trouble of any kind. This installation was made by the Lufkin Electric Light & Power Co., Lufkin, Texas. The pump is a Gould's triplex having a capacity of 350 gallons per minute, and is driven by a 2,200 volt, 50 h.p. Westinghouse motor. It operates against a head of about 130 lbs. and is equipped with a relief valve, so that it can be started against this pressure without injury.

◆

SAVING ELECTRIC LIGHT BILLS.

MR. F. E. OSGOOD, proprietor of the Osgood Hotel, Cookshire, Que., has devised an interesting means of saving electric light bills, and has had it in operation for several months now.

Like all hotel keepers, Mr. Osgood has experienced trouble with guests going away and leaving the electric lights burning in their rooms. Neither King's English nor good example would induce them to turn the switch off when they left, and to meet the situation, the hotelman had a placard posted in each room, which reads:

To My Guests.

God in His infinite goodness controls all things, but this electric light is now controlled by a meter. Please turn out the light when not in use and forever oblige,

Yours sincerely,

F. E. OSGOOD.

Comment on the unusual placard has been wide, but it has resulted in a material lessening of work for the meter, and a consequent reduction in the electric light bill.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Toronto, Ont.—The C.P.R. are contemplating moving their roundhouse from John St. to Runnymede.

Hull, Que.—C. P. R. engineers have been surveying in this vicinity, and it is believed the company will erect some shops here.

Sarnia, Ont.—The Sarnia Fence Co. recently took over the Regal Fence and Gate Co. The latter plant is being doubled in capacity, for the manufacture of more styles of farm fencing.

Ottawa, Ont.—A. H. Coplan & Co., 135-137 Broad St., Ottawa, Ont., manufacturers of iron, brass, aluminum, etc., castings, are contemplating the erection of a large foundry.

Guelph, Ont.—The Page Hersey Iron, Tube & Lead Co., have purchased all the machinery required for their new bedstead tubing plant, and will be running in a few days.

Toronto, Ont.—The C. P. R. will build a one-storey passenger car repair shop on West Toronto Street, near the corner of Keele Street. The building, which will be of brick, will have five lines of tracks, and will cost $26,000.

Hamilton, Ont.—The B. Greening Wire Co., Ltd., mfrs. of wire rope, wire cloth, etc., Hamilton, recently built an extension to their plant for the manufacture of screen cloth for supplying special orders promptly. The machinery will be installed in about a month.

Quebec, Que.—Work will be commenced next week on the N.T.R. car shops. They will be among the finest on the continent and will cost about $1,560,000. The buildings are located so as to allow for future expansion.

Tofield, Alta.—The Tofield Foundry and Machine Co. is now awaiting the arrival of their boilers to begin active work at their plant. The town has given instructions to the G. T. P. to instal the industrial spur as quickly as possible.

Welland, Ont.—Canadian Billings & Spencer Ltd., makers of drop forgings, have recently built a new power house, installed a 5,000-lb. steam drop hammer, and an extra heavy trimming press in the forge shop. In the machine shop they have recently installed a new die sinker.

Ottawa, Ont.—The Flexible Railway Supply Co. of Canada, soon to be incorporated at Ottawa, will erect a plant here to employ 500 men, to manufacture railway supplies. Chas. Forth, Boston, is manager; temporary offices, 340 Queen St., Ottawa.

Lindsay, Ont.—The Cole-Burger Brass Mfg. Co., Toronto, makers of polished brass goods, such as urns, flower pots, etc., will build a plant here, employing 25 men to start, if given a site and a loan of $12,000. Voting will take place on July 24. The new plant will include a foundry, and much stamping, polishing, and finishing machinery will be purchased.

Electrical

Brampton, Ont.—The electric lighting system will be extended.

Goderich, Ont.—The town council contemplates installing a lighting system for parks and bridges. Mayor, C. A. Reid.

Montreal, Que.—The management of the C.P.R. is preparing plans for electrification of its lines within 100 miles of Montreal.

Aurora, Ont.—The ratepayers voted against paying $26.29 for Hydro power, accepting the Toronto & York Radial Co.'s offer at $25.50.

PROBABLE EQUIPMENT REQUIREMENTS

The undernoted firms are now, or likely to be soon in the market for new equipment, etc. For fuller details, reference should be made to the news items:

Machine Tools.

Flexible Rly. Supply Co., of Canada, 340 Queen St., Ottawa, Ont.

The Cole-Burger Brass Mfg. Co., Toronto.

Woodworking Machinery.

Chaudiere Lumber Co., Chaudiere Jct., Que.

Nelson & Foster, Winnipeg, Man.

W. J. Banting, Edgewood, B.C.

J. & W. Duncan, Ltd., Montreal, Que.

Willis Piano Co., Montreal, Que.

Turbo Generators.

Toronto Hydro-Electric Commission.

Steam Boilers.

Toronto Hydro-Electric Commission.

Electrical Supplies.

Hamilton Hydro Board, Hamilton, Ont.

McCuaig Bros. & Co., Montreal, Que.

Town Council, Goderich, Ont.

Town Council, Brampton, Ont.

Macleod, Alta., town council.

Foundry Supplies.

A. H. Coplan & Co., Ottawa, Ont.

The Cole-Burger Brass Mfg. Co., Toronto.

Gas Mains.

National Gas Co., Hamilton, Ont.

Generators.

Toronto Hydro-Electric System, Toronto, Ont.

Railway Contractors' Supplies.

Niagara Falls, Welland and Dunnville Rly., Welland, Ont.

Essex Terminal Rly., Windsor, Ont.

Motor Generators.

Winnipeg Board of Control.

Incinerators.

Hull, Que., city council.

Waterworks Supplies.

Macleod Alta., town council.

Gas Engines.

Berlin, Ont., Light Commission.

Motor Service Truck.

City Commissioners, Saskatoon, Sask.

Sewage Pumping Engines.

Toronto Board of Control.

London, Ont.—The London & Lake Erie Transportation Co. have refitted their old powerhouse, owing to interruptions in the Hydro-Electric service.

Toronto, Ont.—The Toronto Hydro-Electric Power Commission have practically decided to build a $1,000,000 auxiliary steam plant on the water front.

Hamilton, Ont.—Engineer Sifton of the Hydro Board, will purchase arc lamps for city lighting. An arc lamp invented by the American Westinghouse Co is being considered.

Toronto, Ont.—There is talk of the Ontario Hydro-Electric Commission building a second transmission line between Hamilton and Dundas, capable of transmitting 10,000 volts.

Hamilton, Ont.—The Canadian Westinghouse Co. last week supplied another 10,000 k.w. generator to the Canadian Niagara Falls Power Co. It is similar to those previously installed.

Montreal, Que.—McCuaig Bros. & Co., who contemplate the erection of a large generating plant, have interviewed the civic officials of Granby, Que., with the object of disposing of 2,000 horsepower there.

Hamilton, Ont.—Complaint was made to the Board of Control last week by City Engineer Macallum that Hydro-Electric power was off from 3 o'clock until 10 o'clock. There was some discussion as to the best method of furnishing an auxiliary service for the waterworks pumps, and the matter was left in the hands of Controller Cooper.

Berlin, Ont.—The light commission has instructed Superintendent McIntyre to secure an estimate of the cost of changing the old producer gas engine now out of commission to a modern one, and have it connected with electric generators. It is estimated that sufficient power can be developed by this change to operate the street railway service during hydro interruptions.

Montreal, Que.—It was announced this week by Edwin Hanson, president of Montreal Water & Power Co., that the new proposition for sale of St. Henry Plant to the city would be placed in the hands of the city within a day or two. Mr. Hanson explained the delay has been caused by the fact that most of the papers and documents of the company were held in England. It had also been necessary to examine conditions in other cities where plants of this kind were taken over by the corporations.

Municipal

Hull, Que.—The city is considering the purchase of an incinerator. J. A. Laforest, engineer.

Galt, Ont.—The ratepayers have voted in favor of spending $70,000 on a trunk sewer through the heart of the town.

Wetaskiwin, Alta.—The town council are having gas wells drilled to supply fuel for the civic powerhouse.

Bradford, Ont.—The town council will ask the ratepayers to authorize the loan of $20,000 to the Watson-Smith Co., who will build a factory, employing 75 men.

Macleod, Alta.—The ratepayers have sanctioned the expenditure of $46,000 for waterworks and electric light extensions; $36,000 for sewerage construction, $81,000 for filtration plant, and $50,000 for sewerage disposal plant.

General Industrial

Preston, Ont.—The ratepayers have decided to loan money to the Preston Chair Co.

Orangeville, Ont.—The town will lend John N. Dodds, of Alton Village, $30,000 to start a knitting factory.

Vancouver, B.C.—The American Can Co. will build a plant here at a cost of $85,000, tenders for building which have been called.

Wallaceburg, Ont.—The plant of the Hawken Milling Co. was partly destroyed by fire of unknown origin on Saturday morning, July 5.

Prince Rupert, B.C.—W. E. Losee, formerly manager of the cement works at Tod Creek, is arranging for the construction of a new plant on the G.T.P.

St. Catharines, Ont.—The Armstrong Cork Co. will locate outside the city limits in Grantham. It will have fourteen acres of land, and will erect buildings worth $75,000.

Montreal, Que.—The Willis Piano Co. are building a $10,000 plant at Ste. Therese, Que., 3 storeys, 100 x 150. Contractors: James Shearer Co., Montreal.

Dunham, Que.—The Creamery owned by G. F. Masse, of East Berkshire, Vt., was destroyed by fire on July 3, together with machinery and power house. It will be re-built.

Berlin, Ont.—The Beck Duplicator Co., New York, has secured an option on property here for erecting a Canadian branch plant employing 150 hands. H. M. Isaacs, sec.-treas.

Ottawa, Ont.—Plans are to be ready this week for the new elevators which the Government will erect at Moose Jaw and Saskatoon. The cost of each will be $1,000,000, and their capacity will be from 3,000,000 to 4,000,000 bushels.

Prince Albert, Sask.—The city is developing 13,000 h.p. at La Colle Falls, the work being carried out by the Ambursen Dam Co. $1,000,000 is being spent and completion is expected next spring.

Gananoque, Ont.—The ratepayers on July 7 voted in favor of giving a ten year contract, and a 30-year franchise to the electric light company. The Gananoque and Arnprior Railway by-law also passed.

Chatham, Ont.—The Canadian Concrete Products Co. will establish a factory here for the manufacture of concrete culverts, railway signal appliances, concrete posts and similar lines. Work on the factory building will be commenced at once.

Montreal, Que.—The Marine Laundry Co. plant was destroyed by fire Monday and the lumber plant of Geo. Roberts & Co. was gutted. The laundry building was owned by D. Ouimet, and the business by F. E. Ballou, of 2548a Park Ave. The losses are covered by insurance.

Wood-Working

Cobalt, Ont.—The Northern Lumber Mills, Limited, suffered loss by fire recently.

Walton, Ont.—The saw mill of John McDonald was destroyed by fire recently.

Englehart, Ont.—Lafleur's lumber and planing mill at Earlton was destroyed by fire on July 1.

Edgewood, B.C.—A sawmill, planing mill and shingle mill will be erected on the lake shore site adjoining Edgewood, B.C., by W. J. Banting.

Winnipeg, Man.—Nelson & Foster, 1398 Erin street, have obtained a permit for the erection of a sash and door factory at a cost of $5,000.

Thorold, Ont.—The MacCormack Interests, who are completing a new two-machine news-print mill at Thorold, have decided to build a seventy-five-ton sulphite mill immediately.

Chaudiere Jct., Que.—The lumber mill of the Chaudiere Lumber Co. was destroyed by fire on July 2, the loss being $25,000 covered by insurance and Messrs. McCrea, Tobin, Sherbrooke, are interested.

Montreal, Que.— J. & W. Duncan, Ltd., are constructing a new planing mill at their yard, 1833 Ontario street east, Montreal, to replace a mill burned out last fall. It will be constructed on a site 110 x 775.

Building Notes

Red Deer, Alta.—Lang & Major, architects, Calgary, are preparing plans for a new hotel for the Calgary Brewing Co.

Railways--Bridges

Windsor, Ont.—Engineers are laying out a line to Amherstburg through Ojibway. It is thought to be the Essex Terminal Railroad.

Ottawa, Ont.—The contract has now been let for the Le Pas to Port Nelson lines, and 1885 miles of steel will be laid this fall.

Whitby, Ont.—The laying of steel reached Whitby on the new Lake Shore line of the C. P. R. on July 3. This makes a continuous track from Agincourt.

Montreal, Que.—The first motor 'bus of the new type apeared on the city streets on July 1. The 'bus is the output of the Stockwell Motor Co., 626A St. Catherine Street.

St. Andre d'Acton, Que.—Plans and specifications have been prepared for a $8,800 concrete and steel bridge over White River. J. S. Beaudet, secretary-treasurer.

Ottawa, Ont.—The Government are considering a proposal to build a bridge across the narrows connecting Halifax and Dartmouth, N.S. Engineers are now making surveys.

Toronto, Ont.—By the end of the present year a double track will be laid by the C. P. R. from Toronto to Guelph Junction. Next year 189 miles further west will be double-tracked.

Welland, Ont.—Contracts for constructing the Niagara Falls, Welland and Dunnville Railway will be let shortly. The estimated cost will be $600,000. The first section from Niagara Falls will be completed this autumn.

Nanaimo, B. C.—Engineers are at work making plans for the new freight and passenger yards on the E. and N. Railway, one of the C. P. R. subsidiary lines in British Columbia. A new passenger station will be built, the work being started shortly.

Galt, Ont.—Johnson Bros., the general contractors for the construction of the Lake Erie and Northern Railway, have now a huge steam shovel at work excavating at a couple of big cuts, and providing material for a big fill-in to be made just north of the foot bridge, about three miles from Galt.

Ottawa, Ont.—The Cook Construction Co. of Sudbury, Ont., and A. B. Wheaton, of Amherst, are joint contractors for the Halifax Terminal Railway at a contract price of $1,500,000. The line is 5 miles long, and will run from Rockingham to the site of the proposed terminal works. It will be known as the Halifax Terminal Railway.

Quebec, Que.—It is expected that a decision will soon be reached in connection with the proposed new railway bridge over the St. Charles River. An arrangement has been reached between the city and the railways whereby the projected bridge will be so constructed as to permit of general traffic, and the cost will be jointly shared by the city, the Quebec and Lake St. John, Canadian Northern Quebec, and Q. R. L. H. & P. Co. Railways, in addition to the subsidy from the Government. The plans provide for a carriage driveway, footpath for passengers, street cars and railway crossings.

Water-Works

Mount Dennis, Ont.—The ratepayers are urging incorporation to allow them to construct a waterworks system.

Contracts Awarded

Point Claire, Que.—Laurin & Leitch, Montreal, have secured the contract for building the electric lighting plant here.

Eburne, B. C.—R. McLean & Co. have been awarded the contract for installing sewers in Eburne. Their tender was $174,390.

Sarnia, Ont.—The Reid Wrecking Co., Sarnia, have been awarded a contract to raise a dredge which sank off Buffalo harbor recently. The contract price is $17,200.

Kentville, N. S.—Heap & Partners, of Montreal, have been awarded a contract for the supply of almost three miles of steel pipe for the extension of the water works system.

Fort William, Ont.—The contract for the construction of three tunnels for the city's water works has been awarded to the Moran Construction Co., Carleton Place, Ont.

Montreal, Que.—The C.P.R. have awarded the Canadian General Electric Co. the contract for the electrification of their line between Castlegar and Rossland. They will use 2,400 volts and the direct current trolley system.

Montreal, Que.—John S. Metcalf Co., Ltd., Montreal and Chicago, construction engineers, have been awarded the contract for the rebuilding of the Roman Catholic Cathedral at Charlottetown, Prince Edward Island, destroyed by fire some months ago.

Tenders

Ottawa, Ont.—Tenders for a steel pontoon gate lifter, Trent Canal, will be received by L. K. Jones, assistant Deputy Minister of Railways and Canals, up to July 29.

Winnipeg, Man.—The Board of Control is in the market for a 1,000 K. W. motor generator, tenders for which will be received by M. Peterson, secretary, up to August 9.

Saskatoon, Sask. — Tenders for a motor service truck for the fire department will be received by the chairman of the commissioners up to July 31. F. E. Harrison, Mayor.

Toronto, Ont.—Tenders will be received by registered post by the Board of Control up to July 29 for the supply of portable sewage pumping engines. H. C. Hocken, Mayor.

Ottawa, Ont.—Six tenders have been received for the new government dry dock at Levis, estimated to cost four million dollars. Canadian, British and American firms have submitted proposals, which are now being figured out. The contract will probably be let this week.

Refrigeration

Moose Jaw, Sask.—H. F. Mooers, president of the Moose Jaw Cold Storage Co., is arranging to add an ice making plant.

Toronto, Ont.—H. Arnold has had his meat market equipped with a 6-ton "York" refrigerating plant by the Kent Co., Ltd., Montreal, Que.

Toronto, Ont.—An 8-ton "York" refrigerating plant is being installed in R. R. Bullen's apartment house by the Kent Co., Ltd., Montreal, Que.

Saskatoon, Sask.—The Saskatchewan Abattoirs, Ltd., has been organized and will build an abattoir and cold storage plant to cost about $100,000 or over.

Toronto, Ont.—The Harris Abattoir Co. is adding to its equipment an 18-

ton refrigerating plant, furnished by the Vilter Mfg. Co., Milwaukee, Wis.

Montreal, Que.—The University Club is adding to its equipment a 2-ton refrigerating machine, furnished by the Linde-Canadian Refrigeration Co., Montreal.

Toronto, Ont.—The T. English Co. have had installed in their dairy by the Kent Co., Ltd., a 6-ton vertical, single-acting belt-driven "York" refrigerating plant.

Calgary, Alta.—The Crystal Ice has completed arrangements for the construction of a large ice making plant and artificial ice skating rink, to be erected shortly.

Miscellaneous

St. John's, Nfld.—Five men were killed when a boiler in a new mill at the Alexander Bay Lumbering Co.'s station exploded July 2.

Nova Scotia Steel and Coal Co.—The output of the Nova Scotia Steel & Coal Co. in June was 67,088 tons of coal mined, 47,200 tons of ore mined, and 7,226 tons of iron and 7,147 tons of steel produced.

Alfred J. Jones, Montreal, has been appointed Canadian agent for Hick-Hargreaves & Co., Ltd., of Bolton, Eng., who have commenced the manufacture and sale of Diesel oil burning engines.

New Freight Shed.—The C. P. R. has taken out a building permit at Lethbridge for the construction of a new freight shed, to cost about $20,000, and it is expected that the work will be commenced in a few days.

Engineer wanted.—Applications from candidates qualified to fill the position of engineer for structural steel work in the chief architect's branch of the Department of Public Works, Sub-division A, of the Second Division, Ottawa, at a salary of $1,800 per annum, will be received not later than July 14. Wm. Foran, secretary of the Civil Service

Telegraph Poles for Panama.—The telephone and telegraph poles to be used along the Panama Canal will be cut from Graham Island, British Columbia. J. J. O'Flynn left last week by Grand Trunk Pacific steamer to superintend the work of getting the poles out. They will be put in the water at Sewall, rafted to Prince Rupert, and thence shipped south. The contract, which was obtained by S. D. Sewall and his associates in Vancouver, is for 5,000 poles, and delivery is to be made in September and December.

The American Engine Co., of Bound Brook, N. J., have recently received an order from the Minnesota & Ontario Power Co., of Minneapolis, Minn., for two 500 H.P. four-cylinder variable speed paper mill engines. These engines are to be installed in the new mill of the above company, which is located on the Canadian side of the Rainy River at International Falls. They are designed for a wide range of speed, and are equipped with an improved governing mechanism for giving close regulation, insuring thereby an even thickness of paper. The engines are duplicates of that now being built for the Donnacona Paper Co., of Donnacona, near Quebec.

Pigeon, Pigeon & Davis, patent solicitors, 71A St. James Street, Montreal, report that 152 Canadian patents were issued for the week ending June 17th, 1913, of which 111 were granted to Americans, 22 to Canadians, 14 to residents of foreign countries and 5 to residents of Great Britain and colonies. Of the Canadians, who received patents, 8 were residents of Quebec, 8 of Ontario, 2 of Alberta, 1 of Saskatachewan, 1 of Nova Scotia, 1 of British Columbia and 1 of Manitoba. In the United States for the same week, 636 patents were issued, 9 of which were granted to Canadian inventors.

New Inventions.—The following patents have recently been secured through the agency of Marion & Marion, patent attorneys, Montreal and Washington, D. C. Information concerning them will be supplied free of charge by applying to the above named firm.

Canada.

No. 148,847—Morris Brown, Windsor, N. S.—Double edger stave jointer.

No. 148,879—George R. Hudson, London, England.—Coin counting machine.

No. 148,884—Erich Langguth, Neerpelt, Belgium.—Electromagnetic separator.

No. 148,886—Napoleon Lauziere, Drummondville, Que.—Windmill.

No. 148,890—Henry J. Marks, Toowoomba, Australia.—Cushing spring wheel.

United States.

No. 1,064,085—Messrs. A. Plante and G. Stalport, Montreal, Que.—Disappearing safes and vaults therefor.

Marine

Point Edward, Ont.—The plant of the Point Edward Elevator Co., near Sarnia was destroyed by fire July 7 at a loss of $350,000.

Toronto, Ont.—The R. & O. Navigation Co. have abandoned the $1,000,000 dock project owing to the new viaduct plans for Toronto.

New Westminster, B.C.—Work has begun on the scheme for extending the harbor. Misener and Bailey have the contract for driving piles. The dredge to be used is now on the Mercer ways on Lulu Island.

New Incorporations

Consolidated Brick and Tile Co., Ltd., incorporated at Toronto with $40,000 capital, to manufacture brick, etc., at Toronto. Incorporators: J. H. Flett, etc.

General Power Corporation, Ltd., incorporated at Toronto with $5,000 capital, to manufacture electricity at Toronto. Incorporators: R. W. Hart, G. M. Miller, etc.

P. Burns Coal Mines, Ltd., Calgary, has been incorporated to operate coal, iron, or other mines, $1,000,000; by Patrick Burns, Wilfred Corlet, Frederick S. Albright and others, of Calgary.

International Color & Chemical Co., of Ontario, Ltd., incorporated at Toronto to manufacture paints, etc., at Bridgeburg, Ont. F. R. Humpage, A. S. Rumage, etc., of Buffalo, incorporators.

Canadian Foote Co., Ltd., incorporated at Toronto to deal in concrete and other machinery, at Toronto, with $40,000 capital. Incorporators: F. B. Neeve, J. A. Simpson, etc., Toronto.

Canada Metal Mfg. Co., Ltd., has been incorporated at Ottawa, with a capital of $30,000, to manufacture heating apparatus, ventilating apparatus, and goods of sheet metal, galvanized iron, copper or tin. Incorporators— F. W. Montgomery and John R. Wells, contractors, Boston, Mass., and Lloyd E. Urquhart, etc., of Montreal.

Canadian Abrasive Wheels, Ltd., has been incorporated at Toronto with $500,000 capital to manufacture abrasive machinery, pipe coverings, hardware, etc., at Dundas, Ont. Provisional directors: Harley E. Sherk, Geo. Rr. Harvey, etc. Mr. Harvey is secretary and manager of the Canadian Hart Wheels, Ltd., Hamilton, Ont.

Trade Gossip

The Brown, Boggs Co., Hamilton, Ont., manufacturers of tinsmiths', canners' and heavy sheet metal workers' tools and machines, are now operating their recently built foundry addition.

Big Cheque Forfeited.—A cheque for $75,000 deposited by the Halifax Dredging Co. in connection with the contract for building the Prince Edward Island terminal for the I.C.R. car ferry, has been forfeited to the Government through failure to carry out the work. New tenders are being received.

Personal

W. Warbrick, a representative of the firm of Sir John Jackson, British engineers, is now in Canada on a visit.

P. E. Jarman has been appointed acting chief engineer of the City of Westmount, P.Q., until 31st October, the end of the fiscal year.

W. A. Duff, formerly assistant chief engineer on the W. T. R. has been appointed chief engineer of bridges on the Intercolonial Railway.

John G. Smith, of the Welland Machine & Foundries Co., has invented a clam which he has patented in Canada and the United States.

William Farwell, Sherbrooke, Que., has been elected president of International Coal & Coke Co., in place of A. C. Flumerfelt, Victoria, B.C.

F. N. Trites and R. C. Hodgson have been appointed members of the harbor commission of Greater Vancouver. Another member remains to be elected.

Ernie Johnson, of the machine tool department of Mussens, Limited, has returned from the camp at Petawawa where he had been with his regiment.

A. N. Beer, a Montreal C. P. R. engineer has been recommended for the position of assistant city water works engineer for Ottawa, at a salary of $2,500 a year.

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers.
We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.
We can finish steel stampings in Nickel, Brass or Copper.
Send us a sample order.

W. H. BANFIELD & SONS
120 Adelaide St. W., Toronto

Keep in mind the dominant fact that mankind from its first appearance on the earth has been schooled by nature to look for signs; for invitations to taste; for suggestions as to what to wear. Tell your story briefly, forcibly, truthfully, and address it through the proper media and you can successfully apply advertising as a means to increased distribution.

J. L. Ross has resigned from the position of treasurer of the Pease Foundry Co., Ltd., Toronto, and is succeeded by R. B. McKinnon, formerly sales manager.

A. C. D. Blanchard, city engineer of Lethbridge, Alta., has resigned. He has held the position for two years. Before accepting another position he will take a trip to Europe.

F. A. Peck, of the Brown Hoisting Machine Co., Dayton, Ohio, was in Montreal last week calling upon the agents for his firm in Canada, Mussens, Limited.

J. W. Orrock, divisional agent for the C.P.R. at North Bay, has been appointed to succeed C. B. Brown in the position of principal assistant engineer of the C.P.R. at Windsor Station, Montreal.

George Moth, travelling engineer for the C.P.R. out of Lethbridge, has been appointed to the position of district master mechanic at Revelstoke. Mr. Moth will be succeeded at Lethbridge by W. J. McQueen, of Moose Jaw.

John Campbell, second vice-president of the Iron Moulders International Union, of Cincinnati, arrived in Montreal, last week in connection with a demand made by 700 moulders, 400 coremakers, and 100 apprentices in Montreal for a nine hour day.

T. P. Pinckard, formerly new business manager of the Peoria Gas & Electric Co., is now secretary of the Dominion Traction & Lighting Co., of Windsor, Ont. A number of years ago, Mr. Pinckard took the engineering apprenticeship course with the Westinghouse Electric & Mfg. Co., and later was in their sales department.

Albert Nuttall, formerly erection superintendent, Structural Steel Co., and for the last two years superintendent of construction in Canada of the Cleveland Bridge Co., has been appointed superintendent of erection, bridge department,

SECOND HAND MACHINERY FOR SALE

JUST AS YOU were attracted by the Caption "Second Hand Machinery for Sale," so will hundreds of other men all over Canada.

WHY NOT ADVERTISE that machine of yours that is getting too small or that isn't quite suited to the work for which it was intended?

Let "CANADIAN MACHINERY" find a buyer for your machinery or let it find you a second hand machine if you need one. Let "CANADIAN MACHINERY" connect you with good men if you are looking for them or with a better job if you desrve one.

Let it sell for you or buy for you, be it a factory or a machine, a man or a job.

"CANADIAN MACHINERY" is the Market Place for Machinery and Metal Men. Come to it if you wish to buy or sell.

Rates for a stand in the Market Place are 2c per word first insertion, 1c per word each subsequent insertion. Each figure counts as one word.

Ideas at Two Cents Each

¶ An idea that's worth anything at all to a Mechanical man is worth more than two cents.

¶ It might be worth hundreds of dollars.

¶ Every issue of "CANADIAN MACHINERY" is full of practical, helpful ideas. You ought to be able to sift out four each month that would prove of some use to you. Put a value of two cents on each and your subscription has been paid.

¶ You cannot afford to miss even one issue—you might miss the idea that would be worth hundreds of dollars.

¶ The date on the label of your "CANADIAN MACHINERY" wrapper shows when your subscription expires. One dollar will renew it for a year.

Don't put off Renewing—Do it to-day

Classified Advertisements

¶ Those who wish to sell or buy a business, obtain competent help, connect with satisfactory positions, or secure aid in starting new enterprises should not fail to use the Want Ad. Page of "CANADIAN MACHINERY."

¶ If you want to sell or buy a second-hand lathe, planer or any other shop equipment, let "CANADIAN MACHINERY" pick out a seller or buyer for you. How about that second-hand engine or boiler which you would like to dispose of?

¶ "CANADIAN MACHINERY" is the central market place of the machinery trades throughout Canada.

¶ There is always some one looking for just such proposition as you have to offer.

Rates (payable in advance):—2c per word first insertion, 1c per word subsequent insertion, 5c additional each insertion when Box Number is required. Each figure counts as one word.

Catalogues

The General Fire Extinguisher Co., Providence, R.I., have issued their July Number of the Grinnel Automatic Sprinkler Bulletin, which contains illustrations of buildings where Grinnel Sprinklers have been installed.

The "Smooth-On" Mfg. Co. have sent us a copy of their new circular, entitled, "Extracts from Smooth-On Instruction Book No. 12." This little booklet, of 16 pages, contains some interesting information with regard to the "Smooth-On" specialties and several illustrations of places where this material has been used. A copy of the circular will be gladly mailed on request.

The National Machinery Co., Tiffin, Ohio, have issued a pamphlet in connection with their exhibit at the recent Master Mechanics and Master Car Builders' Conventions at Atlantic City. It contains illustrations of the National Bolt Cutters, and of operations performed by them during demonstrations at the Conventions. There are also views of the factory.

Buffing Machinery.—We have received from the Webster and Perks Tool Co., Springfield, Ohio, a pamphlet descriptive of their Ball-Bearing Polishing and Buffing Machines. These machines are made in several sizes, a specification being given of each. One of the principal features is that they are fitted with S.F.K. double row self aligning ball bearings. Copies will be gladly sent to interested readers.

Youngs Company, Birmingham, Eng., have sent us a copy of their catalog which is a description of the Ryland patent worm screw Pulley Block. One of the principal features embodied in this Pulley Block, is the self-sustaining lowering and control brake, which allows the speed of lowering to be controlled by the operator. The reading matter is comprehensive and illustrations clear. Copies of this catalog may be had on application.

Pawling & Harnischfeger Co., Milwaukee, have sent us a copy of bulletin 101 describing their "P. & H." single line Grab Buckets. This bucket was originally designed to meet the requirements of the foundry and is so arranged that it can be readily attached or detached from the crane hook. The opening and closing mechanism has been simplified, a second hoisting cable being dispensed with. The bucket is fully described and illustrated. Copies may be had on request.

Patent Attorneys

MAGNOLIA ANTIFRICTION METAL

GIVES SATISFACTION WHERE OTHER METALS FAIL

Sold by Leading Dealers Everywhere or by
MAGNOLIA METAL CO.,
Office and Factory: 225 St. Ambroise St., Montreal

TRADE MARK TRADE MARK

BEATH CRANES CHAIN BLOCKS TROLLEYS OVERHEAD RUNWAYS

Solve Coal, Machinery and Merchandise Handling Problems.
Hand, Pneumatic and Electrically Operated.

Tell us what you wish to do, and we'll suggest the proper equipment for you.

W. D. BEATH & SON, Limited
Engineers and Manufacturers
20-30 Cooper Ave. TORONTO

You can talk across the continent for two cents per word with a WANT AD. in this paper.

COVENTRY

Noiseless Chains

are rapidly supplanting belting and spur gearing for every form of power transmission because of their proved superiority. They eliminate the vexatious delays due to broken belts and spur wheel teeth. They run unaffected by moisture and heat which would make belts useless. They give positive ratio between driver and driven, and automatically adjust themselves to pinion wear. They so reduce friction and slip that **they transmit power at a standard efficiency of 98 per cent.** Can you afford to do without COVENTRY Noiseless Chains? **Write for full information.**

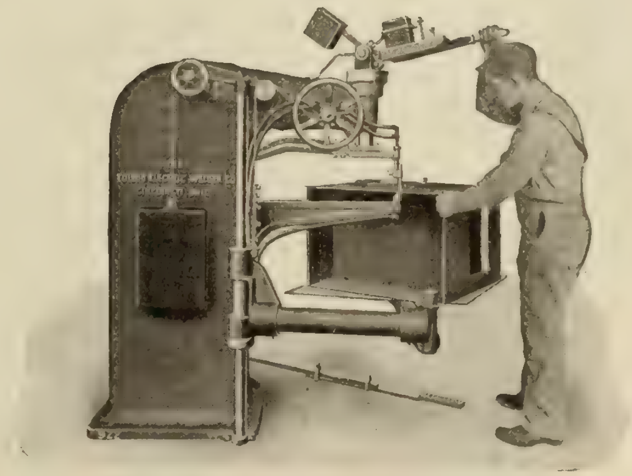
RIVETING COSTS REDUCED

Over 50 Stove Manufacturers are using these machines. Why? Because they can save from 60 per cent. to 90 per cent. in labor costs. If they couldn't make money by using them, they wouldn't buy them. Tell us what you are riveting, and we'll tell you what you can save. Then we will send you a machine on 30 days' free trial.

Our Bulletin No. 12 tells all about Spot Welders; No. 11 about Butt welders.



It's the electric way—the rivetless riveter

NO LEASE. NO LICENSE. NO ROYALTY.

THE TOLEDO ELECTRIC WELDER COMPANY
CUMMINSVILLE, CINCINNATI, OHIO

Right to the Point

Follow the drill right to the point and you'll see that it's **right** to the point. You'll also see our trade-mark, the high-efficiency sign.

This trade-mark is a guarantee which marks every tool bearing it as right, from the shank to the point; first-class in design, material and workmanship.

You'll find it on all

"Detroit" Twist Drills

and it protects you against any loss, for we refund the purchase price or replace any drills which prove defective.

Fix this trade-mark in your mind's eye. Then when you need some tools for a hard job—a job that demands endurance, a steady cut and ability to stand high speeds, order "Detroit" Tools.

Write to the point —To-day?

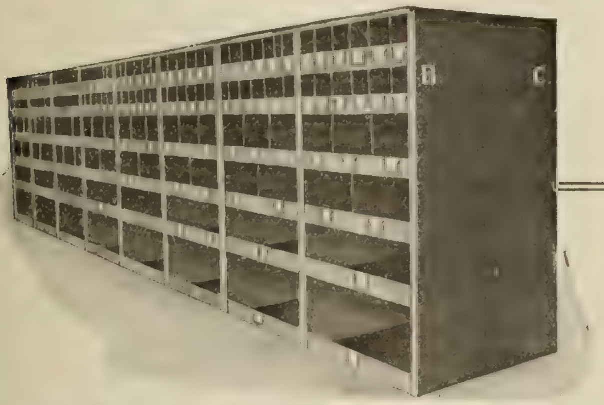
Broken Tangs? Use "Perfect" Double Tang Sockets

What do you do with broken tang drills, otherwise in good shape? With the "Perfect" Double Tang Socket all you have to do is to grind a new tang on the shank below the old one, slip the drill into the socket, and you have practically a new drill—and all done in two to three minutes' time. The new tang is 25 to 60 per cent. stronger.

Folder 19-C gives complete details.

The CLEVELAND Twist Drill Co.

New York **CLEVELAND** **Chicago**



A Big Saving Results from Installing "D.L." Standard STEEL SHELVING

It reduces insurance rates, economizes space and promotes system, and gives the shop a nice appearance.

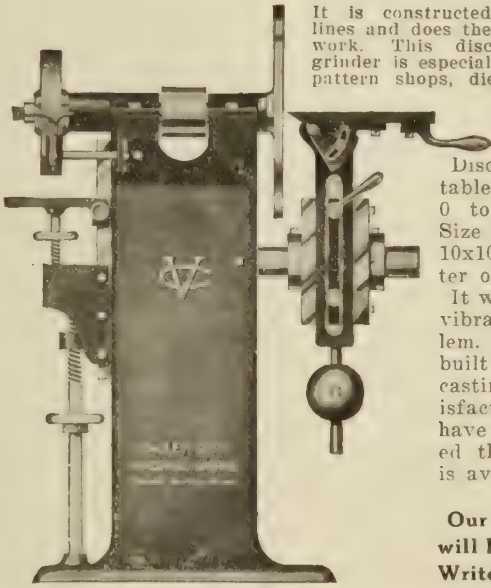
D. & L. Steel Shelving is built on the unit system—sections can be added as requirements expand. It is easily assembled; is adjustable and adapted to many uses.

Let us send our catalog on Steel Shelving, Material Cabinets and Wardrobe Lockers—it contains full particulars.

Dennis Wire & Iron Works Co., Limited
LONDON, CANADA
Toronto Office 36 Lombard Street

No. 9 Disc and Surface Grinder

Here is the Machine That will Meet *Your* Requirements.



It is constructed on practical lines and does the finest kind of work. This disc and surface grinder is especially adapted for pattern shops, die makers, and all kinds of tool and surface grinding.

Disc side has table tilting from 0 to 43 degrees. Size of disc table, 10x10 in. Diameter of disc, 18 in. It will solve your vibration problem. It is strongly built of one solid casting; and satisfactory tests have demonstrated that vibration is avoided.

Our Catalogue will Interest You. Write for it now.

Not an Enterprise for the "Quitter"

¶ "If there is one enterprise on earth," says John Wanamaker, "that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick like a barnacle on a boat's bottom.

¶ "He must know before he begins it that he must spend money—lots of it.

¶ "Somebody must tell him that he cannot hope to reap results commensurate with his expenditure early in the game.

¶ "Advertising does not jerk; it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year, until it exerts an irresistible power."

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eighth Annual Convention *of the* **Federation** *of* **Trades Press Associations** *in the* **United States** *at the* **Hotel Astor, New York, Sept. 18, 19, 20, 1913**

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting, with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

Full information may be obtained from

Taylor Pattern Works, Walkerville,
R. Potts, Toronto.
Toronto Pattern Wks., Toronto.

Perforated Metals & Ornamental Iron Goods.
Canada Wire & Iron Goods Co., Hamilton, Ont.

Penstocks.
Jenckes Machine Co., Ltd. Sherbrooke, Que.
John Inglis Co., Toronto.

Phosphor Bronze Castings.
Tallman Brass & Metal Co., Hamilton

Pig Iron.
Canada Iron Corp., Montreal.
Stevens, F. B., Detroit, Mich.
Steel Co. of Canada. Hamilton.

Pipe Cutting and Threading Machines.
Armstrong Mfg. Co., Bridgeport. Conn.
Bignall & Keeler Mfg. Co., Edwardsville, Ill.
Butterfield & Co., Rock Island, Que.
Can. Fairbanks-Morse Co., Montreal.
Can. Machy. Corp., Galt, Ont.
Garvin Machine Co., New York.
John H. Hall & Sons, Brantford.
A. B. Jardine & Co., Hespeler, Ont.
R. McDougall Co., Galt.
Mussens, Limited. Montreal.
Peacock Bros., Montreal.
Williams Tool Co., Erie, Pa.

Pipe Cutters, Rolling.
Armstrong Mfg. Co., Bridgeport, Conn.
Bignall & Keeler Mfg. Co., Edwardsville. Ill.

Pipe (Second Hand).
Imperial Waste & Metal Co. Montreal

Planer Drives, Electrical.
Lancashire Dynamo & Motor Co., Ltd., Toronto.
Niles-Bement-Pond Co., New York.
Peacock Bros., Montreal.

Planer Jacks.
Armstrong Bros. Tool Co., Chicago.

Planers, Standard and Rotary.
John Bertram & Sons Co., Dundas.
Can. Fairbanks-Morse Co., Montreal.
Canada Mach. Corp., Galt, Ont.
Detrick Harvey Machine Co., Baltimore, Md.
Gardner, Robt., & Son, Montreal.
Garvin Machine Co., New York.
Mussens, Limited, Montreal.
Niles-Bement-Pond Co., New York.
Peacock Bros., Montreal.
Schuchardt & Schutte, Montreal.

Planing and Shaping Machinery.
Can. Fairbanks-Morse Co., Montreal.
Garvin Machine Co., New York.
Niles-Bement-Pond Co., New York.

Planing Mill Exhausters.
Can. Buffalo Forge Co. Ltd. Montreal
Sheldons, Ltd., Galt, Ont.

Pliers.
Canadian Billings & Spencer, Ltd., Welland.
Schuchardt & Schutte, Montreal.

Pneumatic Tools.
Cleveland Pneumatic Tool Co. of Can., Toronto.
Curtis & Co., Mfg. Co., St. Louis, Mo.
Independent Pneumatic Tool Co., Chicago, New York.
Mussens, Limited, Montreal.

Polishing Machines, Electric and Band.
Can. H. W. Johns-Manville Co., Toronto.
Charles H. Besly & Co., Chicago.

Portable Drills.
Times Electric Motor Co., Leitsit, Ohio.

Power Plant Equipments.
Can. Fairbanks-Morse Co., Montreal.
Dodge Mfg. Co., Toronto.

Power Transmission.
American Pulley Company, Philadelphia.
Hare Eng. Co., Toronto.
Jenckes Machine Co., Ltd. Sherbrooke, Que.
The Smart-Turner Mach. Co. Hamilton

Press Screw (Adjustable).
W. F. & John Barnes Co., Rockford,

Presses, Bench Straightening.
Toledo Machine & Tool Co., Toledo.

Presses, Broaching.

Unique Supply House

¶ Supposing the next time you are in need of a piece of machinery, you could go down street to a mammoth supply house in which every reliable manufacturer in America was represented.

¶ Wouldn't it be convenient?

¶ Such a supply house is impossible, but in this Directory you have a substitute that will serve you nearly as well.

¶ The firms represented here have reputations for quality and integrity to maintain, and you will receive satisfactory service at their hands.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

Air Compressors.
Cleveland Pneumatic Tool Co. of Can., Toronto.
Canadian Ingersoll-Rand Co., Ltd., Montreal.
Detroit Foundry Supply Co., Windsor, Ont.
E. J. Woodison Co., Toronto.

Alloys.
Hermann Boker & Co., Montreal.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry Sup. Co., Montreal.
Frederic B. Stevens, Detroit.
E. J. Woodison Co., Toronto.

Ammeters.
Bennett-O'Connell Co., Chicago.
Detroit Foundry Supply Co., Windsor, Ont.
E. J. Woodison Co., Toronto.
W. W. Wells, Toronto.

Autogenous Welding
W. D. Beath & Son, Toronto.
Detroit Foundry Supply Co., Windsor, Ont.

Barrels, Tumbling.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor.
Dominion Fdry Sup. Co., Montreal.
Federal Fdry. Supply Co., Cleveland.
Frederic B. Stevens. Detroit.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
E. J. Woodison Co., Toronto.
Whiting Foundry Equipment Co., Harvey, Ill.
W. W. Wells, Toronto.

Blowers.
Can. Buffalo Forge Co., Montreal.
Can. Hanson & Van Winkle Co., Toronto.
Canadian Ingersoll-Rand Co., Ltd., Montreal.
Detroit Foundry Supply Co., Windsor,
Dominion Fdry Sup. Co., Montreal.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Monarch Eng. & Mfg. Co., Baltimore,
J. W. Paxson Co., Philadelphia, Pa.
W. S. Rockwell Co., New York.
E. J. Woodison Co., Toronto.

Blast Gauges—Cupola.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry Sup. Co., Montreal.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Sheldon's, Limited, Galt.
Frederic B. Stevens, Detroit.
E. J. Woodison Co., Toronto.

Brass Melting Furnaces.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry Sup. Co., Montreal.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Monarch Eng. & Mfg. Co., Baltimore,
J. W. Paxson Co., Philadelphia, Pa.
W. S. Rockwell Co., New York.
Frederic B. Stevens, Detroit.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Brushes, Foundry and Core.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor.
Dominion Fdry Sup. Co., Montreal.
B. Greening Wire Co., Hamilton, Ont.
Federal Fdry. Supply Co., Cleveland.
Osborn Mfg. Co., Cleveland, O.
J. W. Paxson Co., Philadelphia, Pa.
Frederic B. Stevens, Detroit, Mich.
E. J. Woodison Co., Toronto.

Burners, Core Oven.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Monarch Eng. & Mfg. Co., Baltimore,
Osborn Mfg. Co., Cleveland, O.
W. S. Rockwell Co., New York.
Frederic B. Stevens, Detroit, Mich.
E. J. Woodison Co., Toronto.

Cars, Core Oven.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Monarch Eng. & Mfg. Co., Baltimore,
Osborn Mfg. Co., Cleveland, O.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Cars, Foundry.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Toronto.
Monarch Eng. & Mfg. Co., Baltimore,
Frederic B. Stevens, Detroit, Mich.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Charcoal.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor.
Dominion Fdry. Sup. Co., Toronto.
Frederic B. Stevens, Detroit, Mich.
E. J. Woodison Co., Toronto.

Chaplets.
Hill & Griffiths Co., Cincinnati, O.

Clay Lined Crucibles.
McCulloch-Dalzell Crucible Company, Pittsburg, Pa.

Core Binders.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
J. W. Paxson Co., Philadelphia, Pa.
Robeson Process Co., Au Sable Forks, N.Y.
E. J. Woodison Co., Toronto.

Core Box Machines.
Dominion Fdry. Sup. Co., Toronto.
J. W. Paxson Co., Philadelphia, Pa.
E. J. Woodison Co., Toronto.

Core Cutting-off and Coning Machine.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Montreal.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
E. J. Woodison Co., Toronto.

Core Compounds.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor.
Dominion Fdry Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
J. W. Paxson Co., Philadelphia, Pa.
Robeson Process Co. Pennington, N.J.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Core Machines, Hammer.
Brown Specialty Machinery Co., Chicago, Ill.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.

Core-Making Machines.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Montreal.
Federal Fdry. Supply Co., Cleveland.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Core Oils.
Cataract Refining Co., Buffalo, N.Y.
Detroit Foundry Supply Co., Windsor, Ont.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Holland Core Oil Co., Chicago.
Federal Fdry. Supply Co., Cleveland.
E. J. Woodison Co., Toronto.

Core Ovens.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor
Dominion Fdry. Sup. Co., Montreal.
Federal Fdry. Supply Co., Cleveland.
Hamilton Facing Mill, Co., Ltd. Hamilton. Ont
Monarch Eng. & Mfg. Co., Baltimore,
Swindell, Wm. & Bros., Pittsburgh, P.
Stevens, F. B., Detroit. Mich.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.
Wright Mfg. Co., Lisbon, O.

Core Wax.
United Compound Co., Buffalo, N. Y.

Core Sand
Summit Silicia Co., B.

Cranes, Bridge and Jib.
W. D. Beath & Son, Toronto.
Curtis & Co. Mfg. Co., St. Louis, Mo.

Cranes, Electric and Hand Power.
Advance Machine Wks., Walkerville.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Bridge Co., Montreal.
Dominion Fdry. Sup. Co., Montreal.
Mussens, Limited, Montreal.
Northern Crane Works, Walkerville, Ont.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Cranes, Hand Travelling
Wright Mfg. Co., Lisbon, O.

Cranes, Hydraulic.
Dominion Fdry. Sup. Co., Montreal.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Crucibles.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dixon Crucible Co., Joseph, Jersey City, N.J.
Dominion Fdry. Sup. Co., Toronto.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Seidel, R. B., Philadelphia.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.
McCulloch-Dalzell Crucible Company, Pittsburg, Pa.

Cupolas.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor,
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Monarch Eng. & Mfg. Co., Baltimore, Md.
Northern Crane Works, Walkerville, Ont.
J. W. Paxson Co., Philadelphia, Pa.
Northern Engineering Wks., Detroit.

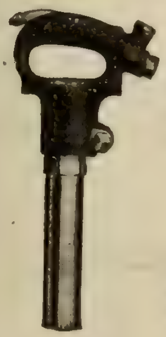
CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.



CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock:—RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Catalog No. 12 mailed on request.

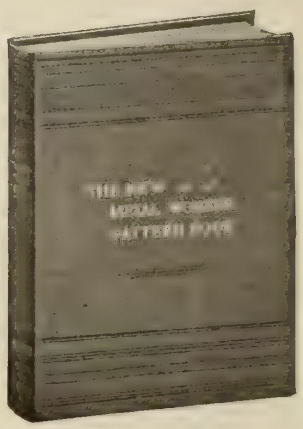
The New Metal Worker Pattern Book

This is the most elaborate and complete work that has ever been brought out for the use of sheet metal pattern cutters. It is printed from new type with a new and improved arrangement, especially convenient for reference and study. Parts of a former edition, entitled The Metal Worker Pattern Book, which have been utilized in its preparation, have been re-written and simplified and later methods embodied. 218 problems are now given, 75 of which are entirely new. A Treatise on Pattern Cutting as applied to all Branches of Sheet Metal Work. By George W. Kittredge. 430 Pages; 744 illustrations; Size, 10 x 13 inches. Cloth bound.



Price, $5.00. Sent postpaid only on receipt of price.

THE MISSING LETTER

You know the beautiful, blue, smooth surface of a Casting is one of its essential qualities.

You know its appearance acts as a silent salesman for that same casting.

You know, also, that the cost is less when the Foundry produces this effect without the aid of the Scratch-room or the Chipping gang.

You, perhaps, know it is possible to procure a Plumbago-Ceylon Lead—that will produce that effect.

Perhaps in the mazes of substitutes sailing under a similar name you have forgotten that I import from Ceylon's Coral Strand just that kind.

Its cost is less—at the end.

The same high standard of excellence pervades, with pocket-book popularity, my entire line of Foundry Facings and Foundry Supplies.

If your letter of inquiry is not missing in my mail, I will tell you more about it.

Rockford
Hand Miller
For Horizontal Or Vertical Milling

The combination screw and lever feed permits maximum efficiency for light, rapid cuts, and for heavy work where a large stock must be removed the two feeds do not interfere, and a change from one to the other can be instantly made.

Vibration is reduced and cutting capacity increased by the Patent flanged support which is bolted near seat of column.

This miller is fitted with latest and improved attachments for special work.

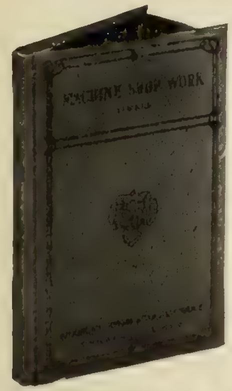
Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.



MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

MECHANICAL DRAWING
KENISON
AMERICAN SCHOOL of CORRESPONDENCE
CHICAGO ILLINOIS

MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price **$1.00**

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price **$1.00**

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price **$1.00**

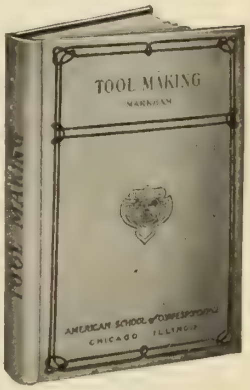
MACHINE DESIGN
GRIFFIN

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price **$1.50**

FORGING
BACON

FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price **$1.00**

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers. Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels —annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price **$1.50**



Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

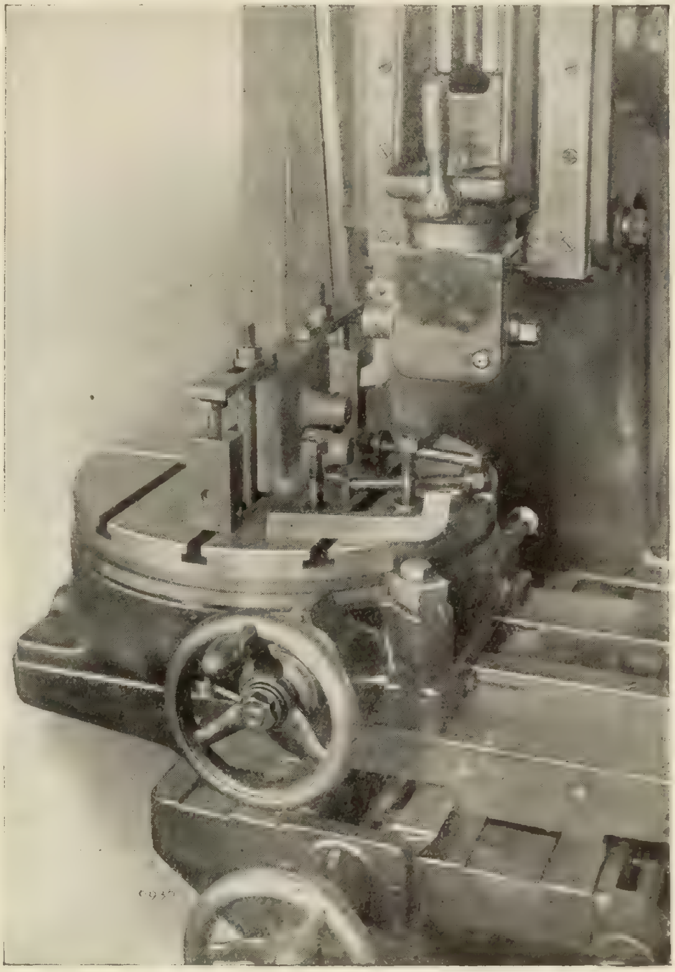
Canada Machinery Corporation Limited
GALT, ONTARIO

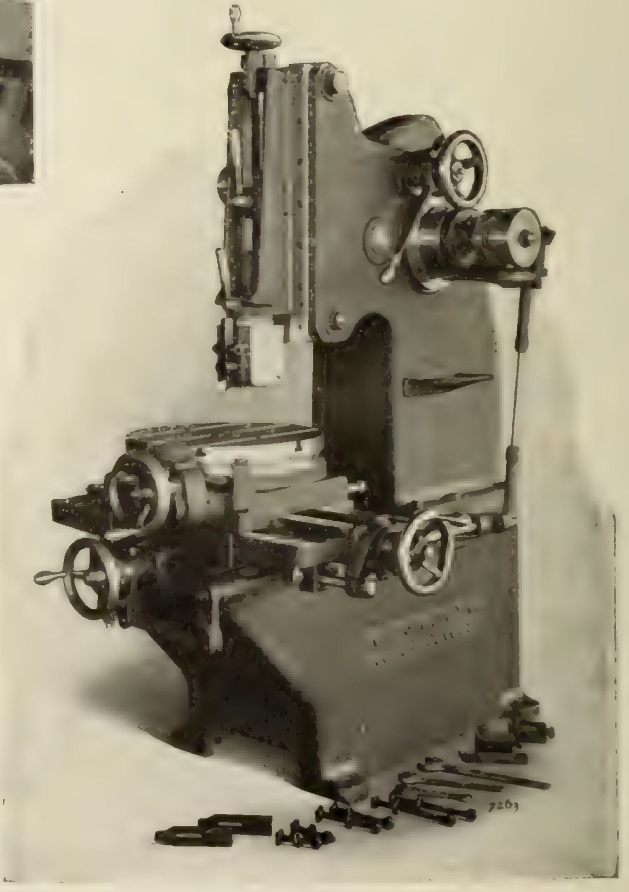


Have You Work Requiring Perfectly Parallel Sides

The swiveling ram head on the

P. & W. Vertical Shaper

will enable you to finish the job complete without changing the original setting and with a high degree of accuracy.



Here's the Way the Vertical Shaper Handles Square or Parallel Work

The ram head is set in the most advantageous position for the first side to be machined and is then firmly clamped. After finishing this side the head is swiveled through 90 deg. or 180 deg., as the case may be. The table is then fed in the proper direction, the machine being provided with automatic quick-acting feeds. By this method of swiveling the tool instead of the work the accuracy of the parallel or square sides does not depend upon the setting of the table but on the construction of the machine. On long, awkward jobs this method is especially convenient.

Write for illustrated circular "Vertical Shaper."

CHEAP AIR OR CHEAP COMPRESSOR, WHICH?

You can't have both because it's the very features that make for cheap air that increase the cost of a compressor.

Curtis Air Compressors

furnish cheap air—

BECAUSE they make available the power they consume, with the least possible loss, and do this year in and year out at the lowest operating and maintenance cost.

Records of fifteen years and longer in service is proof of their longevity. Their capacity is 95% of their piston displacement. Heads and valves, as well as cylinder walls, are water cooled, and they have the fewest possible moving parts (no piston rods, no stuffing boxes, no crossheads, and no guides); hence, there is less friction, less power required, less oil, less attention and greater freedom from breaking down losses.

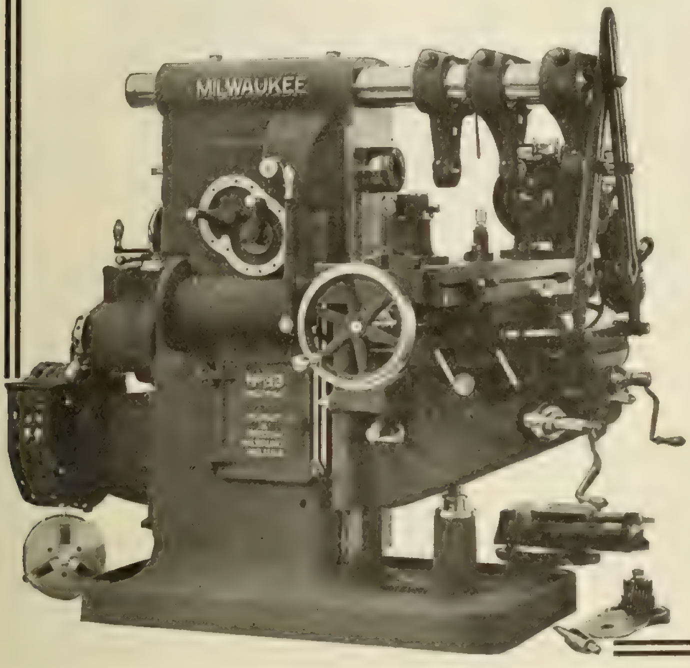
ESTABLISHED 1854

Office and Factory, St. Catharines, Ont. **Stocks carried at Winnipeg and Montreal**

Why Two Over-Arms?

Let the experience of the Manager of the Fort Dearborn Mfg. Co. of Chicago, explain just why for us.



He says that the double over-arm acts as a brace for the arbor and holds the cutters and arbor rigid under the heaviest kind of work. As an example he declares that they have used four 12 in. extra heavy cutters at one time, producing accurate work without chatter, heating, or other signs of overload. He has never had trouble with

Milwaukee Millers

No sprung arbors or broken arbors due to bearings being forced out of true.

The Double Over-Arm construction consists of two steel bars arranged accurately parallel with the spindle and at sufficient distance apart to form a rigid truss when the arbor bearings are clamped to them.

If you do not know of the cascade lubricating system, the box section knee, fool-proof feed arrangement, one-piece ribbed column, and other desirable features of MILWAUKEE MILLERS, ask for the Double Over-Arm circular.

"D-L" Standard Steel Shelving and Bins

CONVENIENT DURABLE ECONOMICAL

This is the most durable steel shelving that you can instal.

Its lasting qualities are many times greater than wooden shelving, and it occupies much less space.

It is built on the unit system. Sections can be added as requirements expand.

Easy assembled, adjustable and adapted to many uses.

Absolutely fireproof.

All shelves provided with label holders.

Ask for catalog on Shelving and Lockers.

The Existence of the Sluggard is a Mistake.

¶ A few men have the courage to use their powers. A few men have the strength of individuality to say what their soul prompts them to say, without fear of being laughed at or criticized. Perhaps only a few men are born to set sail against the North Star.

¶ I would rather dash my individual soul to pieces against life's adversities, problems and perplexities and go down in the mad whirl, and know that I had expressed my soul, that I had used the divine spark, than to live out a self-satisfied, meaningless life—like a potted plant.

¶ To exist is not enough, we must live. A crocodile exists—so does the snail. But the eagle that builds high in the crags and tears the nest from under her young, sending them into the the abyss below that they may learn to fly, has set her plans in tune with the Universal Scheme.

¶ The sluggard was never included in the scheme of the world, any more than the parasite. The sluggard and the parasite were evolved through error—their existence is a mistake. In order to arrive at the highest point, nature found the necessity of going through certain processes, of adopting certain schemes she intended to abandon at some later time. Activity, resistance, conquest, are the basis of all things. The shifting Worlds and Suns of the Milky Way are kept in space by action against action—by resistance against resistance.

¶ And all men are as strong as the opposition they set out to overcome. The average man is satisfied even if he succeeds in obtaining a position to which he can securely fasten himself. The courage to dare, to undertake, to set out, to give expression to that something that makes progress and evolution possible are all strangers to him. Women "get married" and settle down, believing that they have accomplished life's work. They cease to grow, cease to be interesting. Their eye loses its lustre and their smile its charm. The problem has been solved, everything is accomplished—there is nothing more to do.

¶ I believe in rebellion from the mob, from the many. For rebellion is necessary to individuality, Necessary for the soul's freedom. Maeterlinck is a revolutionist, yet he is as peaceful, as calm and composed as the mightiest mountain or the greatest sea. He is a universalist, he lives everywhere, goes everywhere, and travels the universe by sitting at home in a Morris chair .

¶ Mental cripples, donkeys and domestic animals do not rebel. They do not wander from the beaten path. Most men do not even venture to the outskirts of life's prescribed formulas and conventions. They try to shield themselves by keeping something between them and the truth. Something between them and the vast reality that makes the universe of which we are a part. These small men, small because their souls are tied to the stake of fear, are afraid of the lightning of thought and dread the midnight storm of individuality. Every soul should be consumed, should be wrecked in its effort to live.

¶ The bee that gives its life to the hive, the cloud that gathers in the west, throwing itself into fantastic shapes and melting away again into the untroubled sky, are just as much a part of the universal scheme as the mightiest peak or the greatest star. The life of the bee is none the less beautiful, because its existence ends that the hive may live; the cloud is none the less perfect because its individual existence ends with the storm.

¶ The soul that lives is the soul that wrecks itself on expression—that dashes itself to pieces against the shores of universalness in order that its existence may be made eternal.

Instantaneous Self-Alingnment

The key to successful bearing operation is instantaneous and frictionless self-alignment. There is one famous make of ball bearings that possesses this all important feature—SKEFKO.

This instant adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary ball bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature inherent in the bearings themselves, as in Skefko Bearings, is obvious, for the swivelling takes place on balls instead of on a solid bearing.

SKEFKO

" Self-Aligning Ball Bearings "

Eliminate friction, reduce wear, obviate repairs, increase the life of machines, require a minimum of attention and cut down maintenance cost.

Skefko Self-Aligning Double Row, Double Capacity, Double-Life Ball Bearings cost no more than ordinary bearings, and are made in international standard sizes. Their use is practical under any load and speed condition.

We can show you where Skefko Ball Bearings will save power, attention and lubrication, and simultaneously increase your output and improve the quality of your work.

Your best interests demand that you investigate.

The Plant and Product of Barkey Bros., Stouffville, Ont.

Staff Article

The following article covers the description of a plant, which, although comparatively small as we look upon many machine shop enterprises these days, yet illustrates how much a business can be built up successfully in an agricultural district where there are no exceptional advantages, such as cheap power and transportation facilities.

BARKEY BROS. established themselves as general machinists at Stouffville, Ont., over seven years ago. Three years later on account of the considerable increase in their business they built their present plant, which consists of a machine shop, 60 ft. x 32 ft.; a blacksmith shop, boiler and engine room, 22 ft. x 22 ft. Above the machine shop, and covering the same area, is the pattern shop, with pattern stores and warehouse. Adjoining the machine shop is the general office.

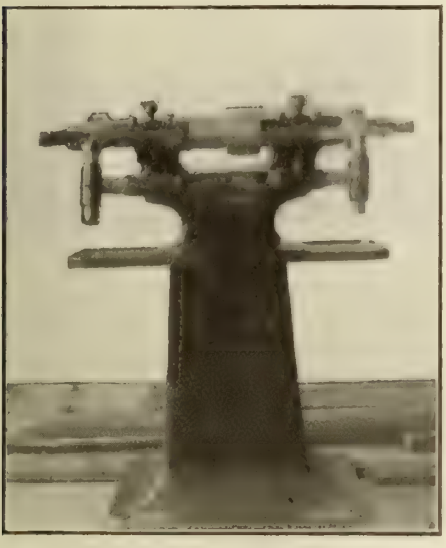

FIG. 1.—NO. 4 GRINDER.

The machine shop contains a number of modern tools, the principal of these being a 16-inch shaper, an 18-inch screw cutting lathe, and a band saw, all by McGregor, Gourlay, Ltd., Galt, Ont.; a 15-inch screw cutting lathe, a 22-inch vertical drill, by the London Machine Tool Co., London, Ont., and a turret lathe, by Jones & Lamson, Springfield, Vt. They have also installed several machines of their own design and manufacture, one of these being the No. 4 grinder, which is adapted to all kinds of heavy grinding, for car, foundry, machine and plow shops. This machine, Fig. 1, is made for wheels up to 16 inches diameter by 2½ inch thick. The spindle is 1⅝ inch diameter by 35 inches long. Its bearings are of ample proportion, being 7½ inches long. The height from floor to centre of spindle is 36 inches.

The No. 1 grinder, Fig. 2, is a compact, light machine, suitable for all kinds of fine work, such as grinding tools, cutter knives, etc. The attachment or compound rest shown in the illustration is used when grinding skate blades. The front and back rests are raised or lowered in opposite directions, thereby facilitating the work. Fig. 3 shows a milling machine for nuts, and the hexagons on globe valves. The work is held by a central vertical spindle, screwed at the end and tightened by means of a hand wheel under the bed, the adjacent lever is for moving the work round. The cutters are secured in special spring chucks, and the feed is controlled by the hand wheels shown at the side, attached to the head-stocks. The saddle which carries the work is operated by the hand wheel, shown in front. Barkey Bros. also make a brass finishing lathe, Fig. 4, which does not call for any special mention, except that it is a well designed and useful tool.

Boring Bar Equipment.

Fig. 5 illustrates a boring bar for reboring cylinders of portable engines and valve chambers of Corliss engines. The chief feature about this device is that it can be fixed to the cylinder and the work done in position, without taking the cylinder down and removing it to a machine shop, thereby causing delay and increasing the cost of the operation. The bar is screwed at one end

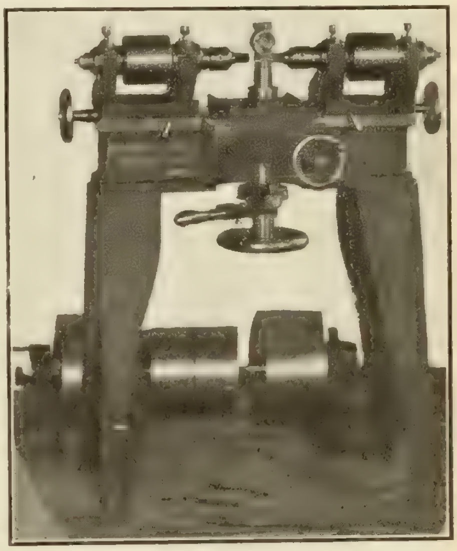

FIG. 3.—MILLING MACHINE.

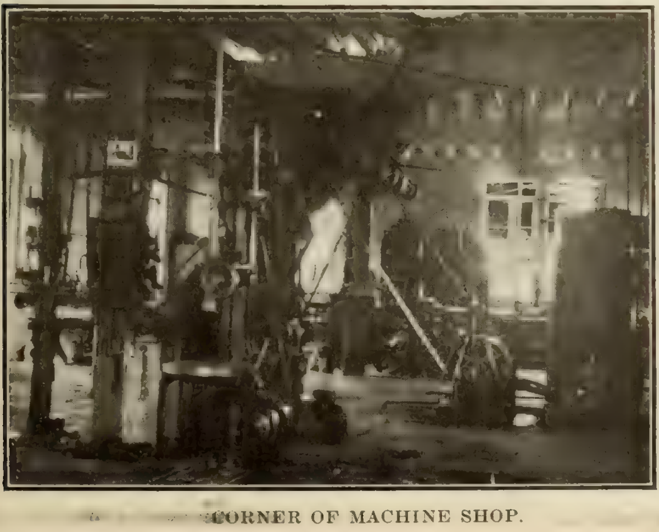
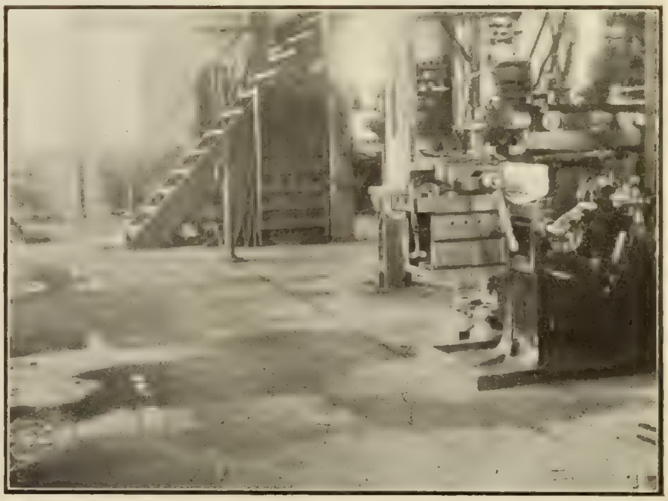


CORNER OF MACHINE SHOP.



CORNER OF MACHINE SHOP.

with a fine thread, the other end being turned so that casting (E) is a sliding fit. Both the cutter (C) and handle (D) are secured by means of set screws. A pulley may be used in place of the handle, if power is available.

To re-bore Corliss valve chambers remove the gland and cover, put the bar through at the cover end, until the cutter is in the desired position, adjust collar (B) screwed to suit threads on the spindle so that it rests in the recess of plate (F), which is secured to studs on the cylinder. This plate acts as a stop, and also keeps the bar central. At the cover end, bolt plate (G) to studs on the cylinder, then secure casting (E) to this plate. The casting keeps the bar central and acts as a guide.

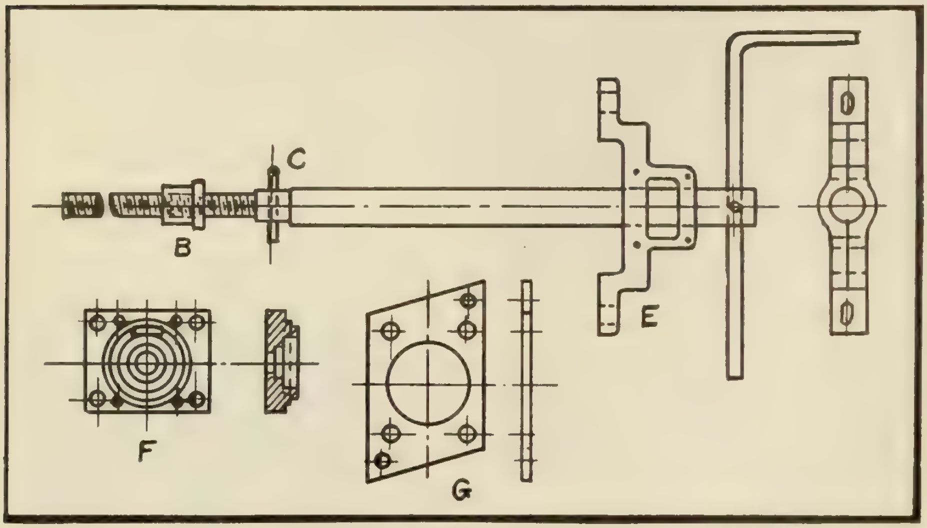


FIG. 5.—BORING BAR DETAIL.

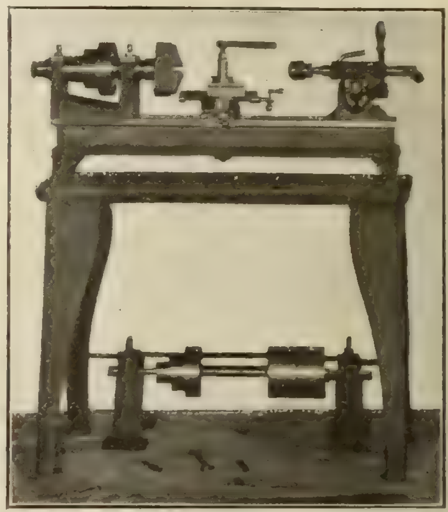

FIG. 4.—BRASS FINISHERS' LATHE.

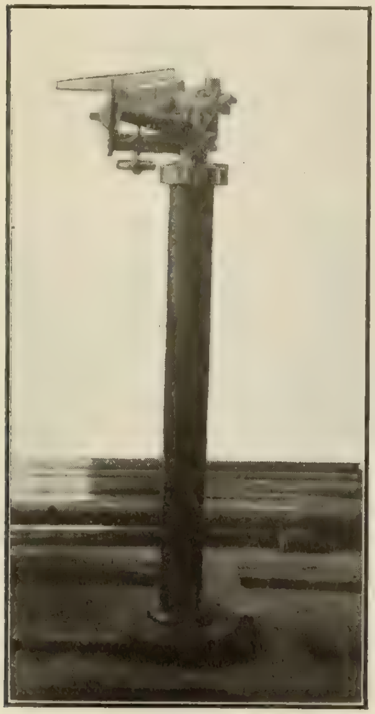

FIG. 2.—NO. 1 GRINDER.

When re-boring cylinders of portable engines, the plates (F) and (G) are not needed, as the collar (B) fits into the stuffing box, a brass collar being put in with it, and the gland is put on and tightened up. This arrangement acts as a stop for the bar, and keeps it central. Plate (G) is not required, as casting (E) is made to suit studs on the cylinder. In the former case, it was too short, and the plate (G) was used to avoid making another casting similar to (E). The operation of reboring a thresher engine cylinder takes about three hours. This apparatus is a great time saver, and it has been used extensively on thresher engines, as well as on Corliss valves by the firm.

BIG COAL DISCOVERIES IN NORTHERN ALBERTA.

It is reported that Dr. Reinhold Hoppe of Oakland, Cal., recently located one of the best coal areas in Western Canada on the Smoky River, in Northern Alberta, about 200 miles north-west of Edmonton. The fields are located within 40 miles of the main line of the G.T.P., and experts have reported that the deposits are anthracite and superior to Pennsylvania hard coal. The area, consisting of 32,000 acres, has been leased by Dr. Hoppe and Mr. Paul Isenburg of Honolulu, a wealthy business associate, and they contemplate starting coal mining operations on a large scale. At the last session of Parliament a charter for a line of railway to tap the coal field was secured.

It is said that the customers secured include the German Government, which requires coal for its naval stations on the Pacific. When the Panama Canal is completed, it is expected that large shipments will be made to Germany and other countries via Vancouver and the Canal.

BORING OUT CORLISS VALVE SEAT IN PLACE.

Modern Principles of Machine Shop and Works Design[*]

Increased attention is being given the design and layout of engineering establishments, the purpose and intent being, of course, the more economical and higher quality production of agiven specialty . The accompanying article is written more particularly from the point of view relative to British engineering plants.

THE lay-out of machine shops must depend on the area, the shape of the ground available, and the nature of the product manufactured by a firm. A ground plan of rectangular from is the best possible, but this is seldom available, except in suburbs clear of other buildings. Where an irregularly shaped piece of land has to be utilized, then some undesirable arrangements are unavoidable; but the aim should always be to avoid handling materials and products more than is absolutely essential. To this end, certain relations of shops to each other, and to railway sidings or canals, will have to be observed, in addition to the internal designs of the shops, the placing of heavy and light machines therein, and the systems of tramlines and dispositions of hoisting machinery. The main problem, therefore, includes much detail that varies with the requirements of different classes of manufacture.

Concentration vs. Isolation.

With respect to the relative positions of shops as affecting the handling of work, two general cases arise. One is concentration in a few buildings, the other, isolation in separate building. To a large degree the choice between these depends on the size of the firm. The larger it is, the more desirable does the isolation of shops, and of departments in shops become, partly because of the necessities of supervision, and partly because of higher specialization. A small firm can have the turnery, machine and fitting shops, all under one roof, in charge of one foreman, while a very large works must not only separate these departments, but must also create sub-departments in each, for light and for heavy work at least. Again, very often further sections must be arranged according to the class of machine used, as planers, drills, gear cutters, grinders and so on. The question then arises whether all these shall be included in one large shop covered by one roof, or be housed in separate buildings or on distinct floors. This can be decided only by each individual firm. Speaking broadly, the present tendency is towards isolation where the work done is of a sufficiently standardized and repetitive character to justify it.

Economy in Handling.

Whatever arrangements are adopted, the cardinal element of economical haulage and handling must not be lost sight of. Raw materials—bars, castings, and forgings—should be taken in, and should with the articles manufactured from them, not return on their tracks, but should progress from shop to shop, or department to department, in orderly sequence. This idea must be uppermost when locating the positions of those departments in which preparatory work has to be done, as the casting, forging, plating departments, and the stores for iron and steel. Raw material should not, as a rule, be transported from one end of the works to the other, but be utilized first nearest the point of debarkation. The cost of transporting a single load is trifling, but the aggregate waste of time and wages in a year becomes enormous.

The same applies to the heavy machine shops into which castings and forgings have to be taken. These should be located nearer to the foundry, smithy, or plating shop than the departments in which light work has to be done. Although these matters may seem obvious to many, they are ignored in some of the older factories, in which the hauling of heavy work over long distances goes on all the while. In view of the enormous quantities of material which have to be transferred from shop to shop in the course of a month or a year, it is clear that the utmost possible facilities should be provided for such transference in order that labor shall not be wasted. This transportation involves the laying down of suitable lines of rails, with turntables where required, and the keeping of all ground floors on the same level, the making of suitable tracks or trolley lines, and the erection of suitable hoisting machinery.

It is well as a rule, when work is for the most part heavy, to conduct operations as far as possible on the ground level. There is, however, always a proportion, greater or less, of light work, and this can well be conducted on upper floors, or in gallieries running round a shop, the latter usually having preference. Upper floors cannot be utilized to the same extent as they are in spinning mills and in light industries in which there is little weight to be elevated and lowered. In shops in which most of the work is light, as in the manufacture of small motors, brass fittings, and articles of similar bulk, floors and lifts can properly be utilized. Lack of light renders fine work difficult on dark days, and runs up the bill for gas or electricity.

The growth of factories in large towns is often so rapid that there comes a limit to the space available for lateral extension. In this way many old firms have become so seriously handicapped that they have cut the Gordian knot by removing out into the suburbs and building a new factory suited to present-day requirements and arranged with a view to further expansion. Some old factories are really nothing but ancient dwelling-houses with partitions between rooms knocked down, retaining the low ceilings, bad light, unsteady floors, and rickety stairs. It becomes difficult for such firms to hold their own against new factories properly laid out, since so little can be done to effect economy in the handling of work.

The modern shop is designed ab initio with a view to the precise requirements either of a business which is already established or of one that is to be developed, and the work of future years is provided for by leaving room for extensions. Instead of building in the heart of a crowded city, most new factories are now erected in the suburbs of cities, or even right out in the country where ground is cheap and room for extension is ample, and where healthful cottage homes can be built for the workmen.

Single-Storey Buildings.

The arrangement of shops on a ground floor only is the modern ideal in factory design, and it is one which is admirably suited for engineers' shops. The work being mostly of a heavy character, its manipulation is awkward on upper floors, but if it can all be dealt with on a ground floor, it can be run in and out, handled with hoists and cranes, while all the trouble of lifting and lowering from upper floors is avoided. Supervision, again, is easier on one floor than on several. A manager or foreman can have more men under more effectual observation, whereas different floors require either extra foremen or divided attention. Hoisting machinery can be more efficiently installed on a ground floor shop than in a storeyed building.

With regard to the buildings themselves, it is better and cheaper to build one-storey shops than those with floors. The walls, having no floors to carry, need not be so thick, and there is no expense for heavy joists, flooring boards, or concrete. More light can be admitted from the roof than from windows in walls, and a north light can be obtained with a saw-tooth roof, which avoids the direct glare of sunshine.

---

[*] From Times Engineering Supplement.

With regard to the walls, in most engineers' shops they are made to fulfill other functions besides that of sustaining the roof. Details which have to be considered are the support of travellers and jib cranes, of main lines of shafting and counter-shafts, and sometimes of machines, such as wall planers, drills, etc., in whole or in part. Brick walls alone are not nearly so suitable for the fulfilment of these functions as are metal columns. This is one cogent reason why columns are generally preferred to brick-work, and it is all in favor of the ground floor shop in which columns take the place of brick walls as supports, the wall often being a mere filling in of a brick course, or even sometimes of sheet iron, between the columns.

Further, the modern shop ideal is to have an unbroken width across two, three, or half a dozen bays. Each bay has its own roof, but the bays are separated only by columns, which leave clear wide spaces across the entire width that is enclosed by the outer walls. The columns, of cast iron, or steel-plated, are made to suit exactly the requirements of the shop, with flanges and brackets to receive the gantries of overhead cranes, the pintles of swinging cranes, bearings for shafting or countershafts, and attachments for wall machines.

In the event of future shop extensions, these bays can be carried out lengthwise by making more identical columns, preserving the uniformity in width and height of the shop. In a well-lighted shop built on this model there is no objection to the erection of galleries of moderate width, provided they do not interfere with the employment of suitable hoisting tackle. They would sometimes block the way of an overhead traveler, but the latter is not required in light departments. Moreover, galleries need not occupy all the length, and they may be raised higher than the crane gantries. Where space is limited, the galleried shops often offer the best solution of a difficulty.

Hoists and Lifts.

Hoisting machinery is a costly item, and one in the laying down of which the best judgment is required. There are so many systems of hoisting adopted now that it is difficult to give statements of general application, but the following considerations should have weight. In the shops themselves, the choice lies between overhead tracks with hoists, overhead travelers, and walking or single-post cranes. The choice of the first two should be favored because they leave an absolutely clear way beneath, but many firms employ the walking cranes, especially in machine shops. Wall cranes will often be needed both for light loads and the local service of heavy machines. Floor trolley tracks are often used. In the yards there should be traveling steam or electric cranes to go wherever required for unloading or loading, for hauling or pushing, in the absence of a yard locomotive.

The hoisting mechanisms for light service which run along the overhead tracks may be divided into two great groups; those which are trolleys only, having eyes from which the actual hoisting machines are suspended, and those that combine the traveling and hoisting tackle in one. The first-named are mostly of the direct lift types, worked by hand, pneumatic, or hydraulic power; the second are electrical. In the hand lifts, pulley blocks are suspended from trolleys pulled along by hand. In the pneumatic and hydraulic types, the movement of a piston or ram in a cylinder is equal to that of the lift. In electrical hoists, tooth gears, drum and wire rope are employed, driven by the motor located on the trolley. The movements of the latter may be controlled from a distance, but more commonly dependent rods with handles are employed, so that the men standing by their loads can operate the hoist from the floor. So extensive are these developments that several firms in England and the United States make a specialty of the fitting of overhead tracks and light hoists for them. For heavy duty, overhead traveling cranes are practically universal. They are made in many styles and powers to suit all conditions, operated from above and from the floor, and, as a rule now, each motion is provided with its own separate motor.

Alternative to the overhead tracks are the walking or single-rail cranes, which have for a long time been favorites in some machine shops. They occupy only the room in which they happen to be engaged for the time being, and the single line of floor and overhead rails does not block the shop much. As they are slewing jib cranes, they cover an area corresponding with the entire sweep of the jib. They were formerly driven by cotton rope chiefly, exceptions being those which have been steam or hand operated, but the electric motor has taken charge of these also, and few of the other types are now likely to be built.

Tramlines.

The question of floor trolley tracks is often difficult of settlement. Where they come into rivalry with overhead tracks is in the handling of work seldom exceeding from one to two tons in weight. The advantage of the overhead system lies in the fact that the floor is left clear. It is not desirable to occupy a shop floor with tramrails where heavy articles are being handled, or where the area available is not ample, or in a small shop or department where the work is all of a very light character. All such areas are best served either with overhead traveling cranes or with overhead tracks with hoists, supplemented, if need be, by swinging cranes to serve heavy machines.

Where small and light work is always being dealt with, the only advantage which tramlines afford is that of bringing in and taking away materials, castings, and forgings, which can be equally well done by overhead tracks without occupying any floor room. The latter have the further advantage that they can be so laid with branch lines as to command practically all the floor area, which cannot be done with tramlines without abstracting too great an area from the floor. In such cases, the ideal arrangement is to run the floor trolley lines up to the entrance of the department or shop, so making connection between it and the outside, but to serve the shop area with overhead tracks. Another objection to tramlines in some shops is the presence of turntables. Speaking generally, the fewer of these the better. They can often be avoided by making connections with curves of large radius and switches.

Racks and Stands.

If disorder and dirt are to be avoided, a free supply of racks and stands must be provided. In too many machine shops, every machine is a focus for litter, the centre of a dumping ground for work waiting to be done, and for the finished pieces, for bolts and angle plates, for templets and tools. Disorder rules; work is covered up and lost, and in dark days the shop is full of stumbling blocks. The provision of racks and stands, and the installation of a tool room are the antidotes to this state of things.

Heating and Ventilation.

Ventilation, except in shops with storeys, is hardly a necessity, because the cubic areas are very large, windows ample, and louvre ventilations are fitted in the roofs, while the employees are scattered. The case is wholly distinct from that of schools, theatres, and place of public assembly, where the conditions are the reverse. Hence, where heating apparatus is installed, it does not usually include provision for changing the air. In hot weather a few electric fans are sufficient for that purpose .

Employees Welfare.

The altruistic side of a works is not neglected in shops that are built now. Formerly a mess room was generally included in shops of any pretensions, but it was generally a bare chilly place, with deal forms and tables, with no provision for cooking other than that which could be done by the men themselves at a common stove or hot plate. Small shops had not even this provision. Not one shop in a hundred had any provision for washing; comparatively few have yet. Washing hands before leaving work was nearly always discountenanced, and absolutely prohibited in some shop rules. As to baths and facilities for change of apparel, the idea would have been generally scouted only half a dozen years ago. In the best shops now, every man has his seat in the dining room, a wash basin, and a reserved and numbered locker. In some a regular kitchen and chef are provided, and the men are supplied with properly cooked meals and various drinks at cost price.

Plant and Product of the C. A. Dunham Co., Ltd., Toronto

Staff Article

The contents of this article go to show that it is possible to lay out comparatively small manufacturing plants, and provide not only the latest and most modern production facilities, but at the same time have installed and in operation appliances and schemes which contribute to the welfare and contentment of the employees.

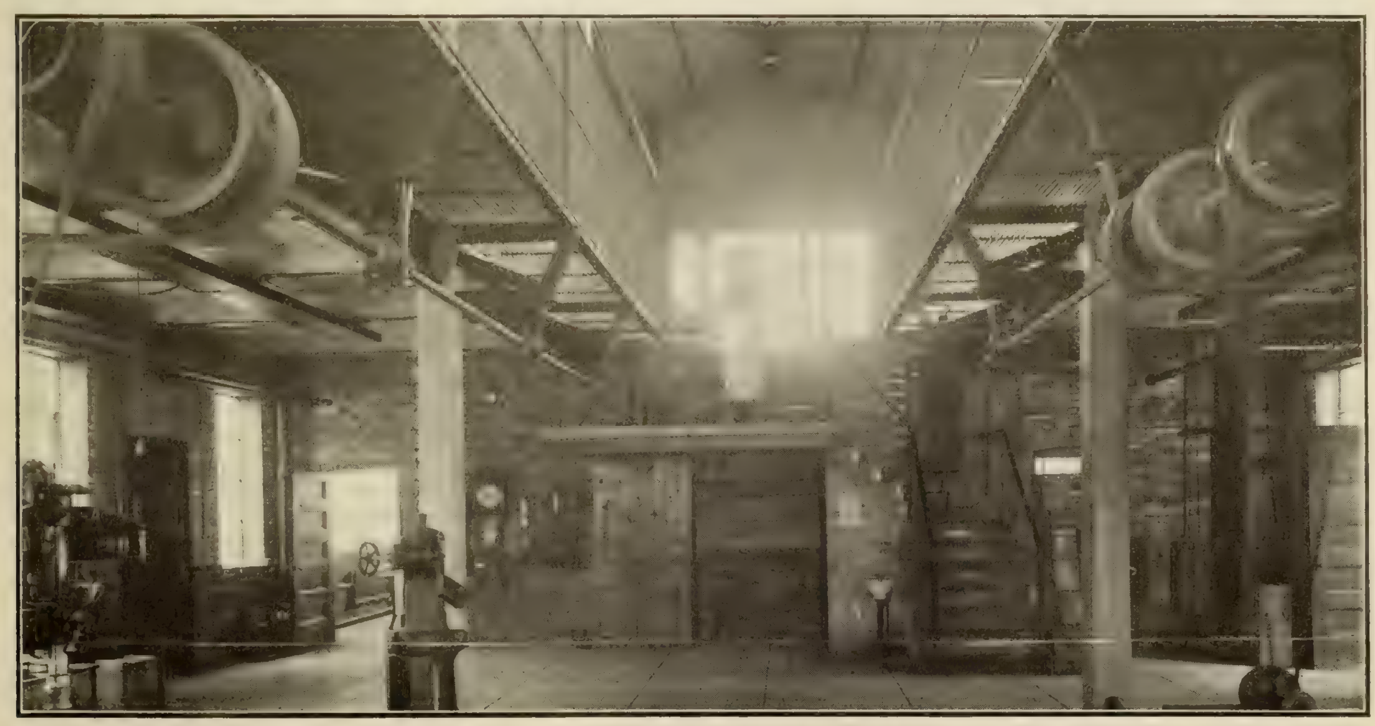
WHAT a difference there is between a well managed plant and one which lacks system! In the first there is smoothness of motion, no running of employees hither and thither, no groups of men gossiping when they should be working. There is an air of perfection about the plant that one hardly associates with a machine shop. Then look at the other; it is just the reverse — dirty, noisy, unsystematic, with parts of machinery lying higgledy-piggledy on the floor, and chaos reigning. It is the American, perhaps, who has seen first the value of order, smoothness and system, and it is the intention of the writer to draw attention to a plant situated in West Toronto, which is a paragon among machine shops of its kind. It is the Canadian branch of the C. A. Dunham Co., Ltd., makers of the Dunham radiator steam trap, the parent plant being at Marshalltown, Iowa.

It is two storeys high, the ground floor being used as a machine shop, and the upper for an office, engineering department, shipping room, etc., though before long the office will be housed in a new building, separate from the works. The upper storey is really a gallery or balcony, occupying two sides, while the centre is open from the machine shop to the glass roof.

On entering at the door, what do we see? First, the floor is composed of large squares of cement, and is clean. To the right is the machine shop, the cast iron department on one side, and the brass on the other. Directly in front is an iron staircase leading to the second floor, but, half-way up, there is a turn, and here the stair broadens out into a platform holding the desk of the shop superintendent. From this observation platform he can see every machine and every man on the floor below. More than that, if he turns around he can see the workmen upstairs, being situated just a few feet lower than they; and he also sees every person who enters the building. He has a desk, with a phone and filing cabinet.

Directly beneath the platform, in a corner, is a sanitary water fountain, kept continually running. This is something new in a machine shop. Its white porcelain bowl looks clean, and the water is cooling.

There are lots of people who claim that it needs a great big plant before it pays to introduce a system; but here is a plant, the product of which is small, and yet it runs on system. On the right of the staircase is a hand-power elevator connecting the two floors, made by the Otis Elevator Co., Toronto, Ont., measuring 3 x 3 feet. When the castings are wheeled in on the truck, instead of being carried by hand upstairs, the truck is pushed onto the elevator. A boy will operate it, and having seen the truck safely on the second floor, climbs the stairs himself. The elevator costs little and eliminates all the running up



VIEW SHOWING SUPERINTENDENT'S PLATFORM WITH ELEVATOR ON THE RIGHT.

and down stairs which the firm had to endure in pre-elevator days.

When supplies are required, the truck is wheeled out again, the castings being in trays, of which there are several. These are pushed to the machine and the operator machines them. Then they are wheeled to the next machine, and so on. The reader will see at once what an inestimable boon the elevator is in a small plant of this description. The plant was built with a view to giving the highest efficiency, giving a smooth flow of material from the time of its arrival in its rough state, to the hour when it is tested and shipped. This perfection is attained easily with the aid of the elevator, which makes the passage of parts from one department to another a simple matter. Incidentally, the truck on which the trays are loaded is the exact size of the elevator floor.

In the case of an institution so clocklike in its movements, there must, naturally, be other features which are worthy of emulation. The manager, Mr. Dickie, was showing the writer into the room for making copper discs—one of the patents on the Dunham steam trap. "Now this is the heart of the works," said Mr. Dickie, as he unlocked the wire door leading into this department. "And so you lock the door," the writer remarked. He stopped to explain that the frail wire doors and partitions had a good moral effect on the men. "They are not locked in," he said. "See, it can be opened from the inside, but not from the outside. And the man who opens that door and leaves the room must have a mission. Prior to the introduction of this system the men could wander from one department to another without any compunction. It has been wonderfully successful."

A peep into Dunham's washroom and lavatory on the ground floor will reveal the twentieth century method of providing workmen with comfort. The writer knows of plants whose washrooms would drive a man home in his grime, and which, in the daytime, to say the least, were revolting. This one is equipped with large, deep individual earthenware wash bowls, supplied with hot and cold water—the type that tempt you to stop and take a dip. The room has a cement floor, is spotlessly clean, and the air is as pure as in the main shop. This is effected by a ventilating system, which draws all impure air through pipes, and induces a current of pure, cool air. On the floor in the corner is a box with brushes and shoe polish—not much, it is true, but it tends to give Dunham's men an unusually clean appearance as they leave the works. There is also a large mirror, and a cabinet containing brushes and combs. If all factories were run on these lines, how much brighter would be the lives of Canadian workmen.

C. A. DUNHAM CO. PLANT AT TORONTO JUNCTION.

Here is another feature which must have a passing reference. Outside, near the entrance to the building, stands a temporary boiler house, containing a 60 h.p. boiler built at Polson's Iron Works, with a chamber for coal. Steam is generated for heating purposes, and for testing the steam traps. Entrance to this can be gained through a door under the superintendent's platform. Several steps lead to a tunnel, which connects the main building with the boiler house. Its dimensions are 4 x 6 feet, and are sufficient to allow one to walk through erect. It contains a pump for the vacuum heating system, motor driven, with an automatic electric control. This tunnel, which is built of concrete, carries the steam and water pipes, as well as the electric wires. Next summer, when the plant is extended, the boiler house will be moved further away, necessitating lengthening the tunnel. Then it will be more useful for carrying wires and pipes.

Whenever an engineering firm can afford, and can find time to cut the grass in front of the office, and grow a few flowers, it is a ten to one bet that they look well after employees in other respects. At Marshalltown, Iowa, U.S.A., the Dunham plant is a beauty spot, and so the Toronto plant will be as soon as the extensions are completed. The gardens are already being arranged.

This is a plant of surprises. The opening of a door will reveal a new department of the existence of which there was no suspicion. Each man is attending to his own work, and that is why this firm turns out 20,000 steam traps a year, with so little ostentation. On the right of the superintendent's gallery is a door leading to the grinding, buffing and polishing department, the equipment in which is to be increased. The castings come in here to be ground

A CORNER OF THE PLANT UPSTAIRS, WHICH IS SERVED BY THE ELEVATOR.

—the first operation—and return afterwards to be polished.

This room leads to another of similar size, now being used as a blue-printing department, which contains a blueprinting machine by the Buckeye Engine Co., Salem, Ohio. When the engineering department is moved into the new office building this room will be equipped as a nickel-plating department.

A word about the machine shop. But for the grinding room and washroom, it occupies the whole of the ground floor. There are electric motor drives aggregating 25 h.p., the Toronto Electric Light Co. supplying the power. All line shafting is equipped with Chapman ball bearings, which tend to give the plant that perfectly smooth characteristic previously referred to.

On the left are four automatic brass turret lathes, made by the Warner and Swasey Co., Cleveland, and one by Bardons and Oliver, Cleveland. There is a power punch, for forming and stamping the disc used inside the steam traps, made by the Niagara Machine and Tool Works, Buffalo, N.Y.; a milling machine, and a tool lathe, both by LeBlond; a No. 3½ Greenerd arbor press, a turret lathe for cast iron work, by the Warner and Swasey Co., Cleveland, and a drill press by the Sibley Machine Tool Co., South Bend, Ind.

After passing the superintendent's gallery, climbing the stairs, one comes at once to the testing laboratory, consisting of a standard radiator of 50 sq. ft., fitted with thermometer and mercury pressure tube, with connections to tanks for collecting water which passes the traps. Steam is admitted to the radiator at a pressure generally used in radiators, and after a time the water condensed is weighed, and the percentage of steam wasted in the trap figured out. There is other apparatus for testing all the heating specialties made by this firm.

On the left is the assembling department, so that traps, as soon as made, are right near to the testing laboratory.

On the extreme right is the department for making copper discs. The disc in a trap allows condensed water to drain from a radiator, but steam will expand it, closing the exit for water. It contains a liquid, which is a Dunham secret.

The building is lighted, so that the superintendent from his platform is able to switch on a single lamp in any part of the building.

* * *

ANTICIPATION.

By Paul Lupke.

THIS is a short talk, intended principally for the primary class—the boys we left behind us—to whom youth still holds out the precious privilege to anticipate, also, incidentally, for their elders.

When we were young enthusiasts, industriously composing essays at school, the one particular subject under treatment was always the most important thing in the world. Now, when the sobriety of riper years has developed a keener sense of proportion, we wisely shun superlatives, yet, even so, I venture to assert that anticipation is the accomplishment that contributes most to success in life.

Said a grammar school principal recently, relying upon a lifetime's solid experience: “We are a nation of ‘Sixth Graders,’ because a big majority of us never went beyond the sixth grade in school. Some of us couldn't, but most of us wouldn't; and to those who really couldn't, let us extend sympathy and help whenever and wherever we can. Just here, I am concerned with those who wouldn't. They give up because they do not anticipate the value of an education beyond the sixth grade.

Wanted to Fire a Boiler.

Asking a young fellow who had every opportunity to acquire a good education why he left school, I got this answer: “There is too much ‘Lady of the Lake’ in that course for me; I want to fire a boiler.” Do you realize how large and difficult a problem that boy compressed in that one sentence? The question of proper home influence, the need of congenial courses, of teachers of strong personality are all unconsciously expressed in it, if we could sound it to the bottom. Surely the burning ambition to fire a boiler is most laudable, and failure to appreciate an intimate acquaintance with the “Lady of the Lake” may prove no great handicap for the young man; nevertheless, if he had stuck to his lessons a while longer, his chances of eventually owning the boiler instead of being obliged to shovel coal into its furnaces indefinitely would have been materially increased.

Alas, youth and inexperience are almost synonymous, and, without the sting of experience, we seldom appreciate a lesson—there's the rub. All that we, who have the experience and lost our youth gaining it, can do is to impress the lesson we learned at such enormous cost upon our boys. The least that fathers who wouldn't, and now are sorry for it, should do, is to try to get it into the heads of their boys “who won't” that they are dead wrong, and, if necessary, emphasize the lesson, according to the precept of a lost art, on another part of their anatomy. If you do succeed in curbing the eagerness of your boy to be out and at it until he is armed with the keen weapons of theory to tackle hard practise, watch the bent of his mind, and give him every possible chance to find out for himself what he really wants to do.

Lucky indeed is the youth who finds his proper place when he enters the ranks; to put it plainly, who gets the job that fits him, the job that fills his heart's desire and his soul's yearning. There is just one such job for each, and that is the job worth watching, waiting and working for; it is the only job in which he can expect true success. Indifference and indolence of parents and the lure of the immediate dollar drive many a boy into a life of stubborn listlessness and stagnancy.

The Misfit.

My boss says: “The man who cannot do his stunt with a smile on his face I won't have in my organization; he sours the whole dough.” My boss is right, and the man who has not found his proper place is bound to be just that kind of an undesirable citizen. If a young man feels the sentiment growing upon him that the business he is in is rotten, he surely will rot in it if he doesn't get out in time. He will settle down to eking out his eight hours of work by the stop watch and hatch grievances the rest of his time, and that will be the end of his growth. He may in due time exact a few additional cents for each one of those eight hours by the joint application of the old testament method of “an eye for an eye, etc.,” but he will be a paid-by-the-hour man for the rest of his life. Never may he pop his head above the deadline of the general average without getting a brotherly whack on it, while all the world is watching and eagerly waiting for those who dare push their way through the crowd and come ahead.

The Thrift Feature.

Next, when you have your job, watch your pennies. Perhaps you only just get along on what you earn—well do it, but when the first raise comes, get on a little while longer just as you did before and save the difference. That gives you your chance—your only chance—to get ahead of the game. Once you start to save, you will soon get the habit and then you are safely on the right road. Keep a weather-eye on your little pile. Shun the hungry horde of installment vendors of trumpery trash that hang on the paymaster's trail like a pack of coyotes. Be deaf, dumb and blind to all the allurements of Florida orange groves, Colorado gold mines, Jersey shore lots and Mexican rubber plantations. Make your money work, but give it a job at home that you can watch and best of all, give it a job in the business your own efforts can help to improve.

Many of our companies have grown real souls of late, and are stretching forth a helping hand honestly to all those who show the slightest disposition to help themselves. One company recently offered its employees stock on a very liberal and equitable basis. Some came in on the deal, more did not. I asked the men why they did not. "I bought a house, and every cent I can spare goes to cut down the mortgage," said one. "My wife is ailing and the doctor and the druggist keep me strapped," said a second. Both valid reasons. "Oh, it's only another scheme to get us tied down good and fast," said a third and more. Now these poisonous microbes of mistrust—but no, that is quite another story.

Here is what a young fellow said: "Why, man, it takes seven years to pay for that stock. Who on earth would bother with a waiting game like that? I have better use for my cash right now;" but had he? He was giving a demonstration right then and there, for he was delivering his harangue from the brass-tacked throne in a mirrored shoeshining parlor, enveloped in a halo of cigarette smoke, while two little Greek boys were slapping their rags across his shining tans with the enthusiasm inspired by the anticipation of a liberal tip. Five cents a day would have paid for a share of that stock. Shining his own shoes and cutting out a pack of cigarettes would have paid for several, and oh, how short those seven years will be when that young fellow gets his chance to look at them from the other end!

Youth the Anticipation Time.

Youth is the time to anticipate. To youth the years are long, but they gather speed like a falling stone. Opportunities do not happen, they are made, and the time to make them is while you are young. In youth, the foundations must be laid for that kind of a life upon which age can look back without regret. That is success. Mere accumulation of money is not success, but the acquisition of so much of it as is necessary to provide for your family and your own old age, nevertheless, is an essential part of success, and without that part, only the exceptional few endowed with genius have ever been called successful.

In conclusion, let me anticipate the fate of this little screed. Some of you may think it worth a momentary clap or two, and when it comes to you later, embalmed among the meaty matter of the Proceedings, some may give it a casual look to the end where it will probably say: "There being no discussion and the luncheon hour being long past due we will now adjourn." Then it will be placed on the shelf to gather dust in peace. Still, some time, somewhere, some young chap—and be he but a meandering office boy—may happen across it and catch an inkling of its true meaning that will help him anticipate in time to set the trend of his mind toward the right road to success.—From an address delivered before the recent National Electrical Association Convention at Chicago.

The Theory and Practice of Screw Cutting on the Lathe

By J. Davies

The author of this series of articles intimates his intention of making the information sufficently simple and clear, that apprentices and others will put the four rules of arithmetic at their command will be able to intelligently grasp the data and apply it in practice.

THE theory part of this series of articles was approved by the Government Inspector, and taught to the apprentices of the Towca Engineering Co., Whitehaven. The practical part of it, that is, the actual operation of the lathe, is the result of experiment and experience combined, and found highly successful in workshop practice. If any point be not made quite clear, the writer will reply to any inquiry addressed to the Editor, Canadian Machinery.

Finding Wheels.

Put down pitch of thread to be cut in form of fraction, the pitch of a thread being the distance from the centre of one thread to the centre of the next.

In a square thread it can be more conveniently measured from the edge of one thread to the edge of the next. Care must be taken however, in measuring the pitch of a thread that we wish to replace. Ascertain first, therefore, whether it is an ordinary single thread, a double, or perhaps triple thread, by taking the point of a pencil or scriber and running it round the thread for one revolution. This will tell you at once what kind of a thread you are up against, and whether it is right or left hand. I have known men measure up a thread without taking this precaution, and find to their dismay when they have the job nearly finished that they have been cutting a single thread when it should have been a double one. This is most likely to occur in cutting an internal thread, as the angle of the thread which indicates a double or treble thread cannot be noticed so readily inside a nut.

A very easy way to express the pitch of any given thread is to draw an horizontal line thus ———— and place the number of inches above the line and the number of threads below the line; the resulting fraction will always be the pitch of the thread.

Example pitch of 6 threads per in.=

$$\frac{\text{Inches } 1}{\text{Threads } 6} = \text{1-6 Pitch.}$$

Apply this rule to all simple threads.

In cases where there is a fractional number, multiply both inches and threads by the least number that will make them both a whole number.

Example—Find pitch of 6 1-4 threads per inch.

$$\frac{\text{Inches } 1}{\text{Threads } 6\tfrac{1}{4}} \times 4 = \frac{4}{25} \text{ Pitch.}$$

Example—Find pitch of 3 2-3 threads in 1¾ inches.

$$\frac{\text{Inches } 1\tfrac{3}{4}}{\text{Threads } 3\ 2\text{-}3} \times 12 = \frac{21}{44} \text{ Pitch.}$$

If the pitch is given is given in decimals, bring it to a fraction by placing cyphers under each decimal figure and 1 under the decimal point thus:

$$.75 = \frac{.75}{100} \text{ or 3-4 and so on.}$$

If given on the blue print in French measurement or millimetres, reduce to a vulgar fraction 25.4 millimetres=1 inch, which is near enough for any practical purpose, therefore 1 millimetre=5-127 of an inch. Keep the 5-127 in mind as the equivalent of 1 millimetre, then multiplying by the number of millimetres, will give the pitch of thread required.

Suppose you were required to cut a pitch of 7 millimetres per in., then the pitch in the form of a fraction would be

$$\frac{5}{127} \times \frac{7}{1} = \frac{35}{127}$$

Having found pitch of screw to be cut, find pitch of leading screw in the same way. The whole principle of gearing up a lathe for screw-cutting is one of ratio or proportion. Suppose thread to be cut is the same as leading screw, then it is evident that the job must make the same number of revolutions in the same time as the leading screw. The ratio of driving and driven wheels must be the same as the ratio of the screw to be cut with lead screw.

To find ratio, multiply pitch of screw to be cut by the inverted pitch of the guide screw.

Example pitch of screw to be cut 1-4.

Pitch of leading or guide screw 1-4. Find ratio.

Invert pitch of leading screw and multiply $\frac{1}{4} \times \frac{4}{1} = \frac{4}{4}$ Ratio

THE LOOSE NUT IN AN ELECTRIC SYSTEM.

By S. W. Worrall, M.Sc., M.E.

IT was recently remarked in the lay press that London could be thrown into darkness by a loose nut. While this in itself is rather an exaggerated statement, it is true that a loose nut may account for a great deal of trouble in an electric system. A case in point has recently come before the Vulcan Co., Manchester, England.

At a certain textile mill driven by three induction motors of the slip ring type, the power is supplied by a three-phase alternator, and the motors form the entire load. The largest motor, which is 175 h.p., gave considerable trouble at various times; at one time several rotor bars burnt out, while at another time the rotor bands were reported slack. These faults were repaired, and all went well until recently, when the trouble developed in a new way. The motor began to hunt on full load, and being the largest on the system, caused the pressure to fluctuate so violently that the no-volt release on the switch was liable to operate and cut the power off the motor. The other motors were also affected, and the entire mill was sometimes brought to a standstill. The only evidence that the large motor was the cause of the trouble was that, when it was not running, everything was quite normal. On half load the fluctuation was less violent and the mill could be kept running.

As the rotor had given trouble before, it was naturally assumed that something had again gone wrong with this part of the motor, and the makers were accordingly called in. The engineer sent could discover nothing wrong, and a second engineer attended. He carefully examined every part, tightened up and adjusted all the contacts and cables, and although he did not locate the seat of the trouble, the fault apparently disappeared. A few hours after he left, however, the fault again came into evidence, and as the motor was insured with the Vulcan Co., an urgent telegram was despatched by the owners of the mill requesting a special engineer to be sent.

Trouble Located.

When the Vulcan Co.'s engineer reached the mill the motor was running on half load, and, without stopping it, a series of observations was made, which showed that the trouble was due to a high resistance in one phase of the rotor circuit. Step by step the fault was traced out, and eventually located to one of the running contacts of the rotor starting switch. The motor was not stopped, but was enabled to take full load by a temporary connection across the three rotor leads, thereby cutting out the starting switch altogether.

During the breakfast hour the slate front of the starting switch was drawn forward, and the suspected connection examined. The nut was found to be quite tight, and only very slight signs of overheating were visible. This connection had previously heated up, but at the time was quite cool.

Faulty Contact.

The observations made, however, left no doubt that the contact was at fault, and as the nuts would not yield to the spanner, they were driven off by hammer and chisel. The contact surfaces were so fused and oxidised that the circuit was practically broken, and the rotor was, therefore, running on two phases instead of three. A new part was made at a local brass foundry, and when fitted the motor took full load in a perfectly normal manner. The actual work was done in the meal hours, and during the working hours the mill was kept running on full load by the temporary connection described above. The faulty contact was very difficult of access, and could not be inspected without dismantling the switch. The screwed stud was about one-quarter inch too short, and the last nut was on the stud for only half its thickness, while the condition of the thread suggested that the nut had been first put on with the threads crossed, thereby becoming tight on the stud without making the contacts secure. If this be the correct explanation, the cause of the trouble had been present from the first, but until overheating was set up, with consequent oxidation and arcing of the contacts, no trouble was experienced.

A similar case occurred at another mill some little time ago; the speed variation being so bad that the quality of the manufactured product was seriously impaired. This time the trouble was caused by loose brushes on the contact arms of the rotor switch, and when these were tightened up the motor ran in a perfectly normal manner. The writer of the article is a member of the Vulcan Co. staff.

IMPROVING NOISY GEARING.

IN some of the large shops in St. Petersburg a simple method of lessening the noise of gearing has been found successful. For gears of less than 18 in. diameter, two sheets of tin are fitted, one on each side of the wheel, so as to box in the space between the rim and the boss, the sheets being screwed to the rim. The space between the sheets is filled with sawdust and No. 4 shot, to eliminate vibration. When the diameter of the gears is greater than 18 in., wooden rings are used instead of tin, attached in the same manner. A felt packing is used to prevent the sawdust leaking out. This arrangement reduces the amount of noise produced by the gearing, and by closing the spaces between the spokes of the whee lmakes it impossible for a workman to get his arms or tools caught.

STRONG SOLUTIONS FOR ELECTRO-GALVANIZING.

THE zinc salt employed almost exclusively for electro-galvanizing is the sulphate. This is the cheapest of any salt that can be used for the purpose. The only other modification employed for the electro-deposition of zinc is a cyanide solution which is now and then used, although rarely, in instances where the sulphate cannot be employed.

Zinc sulphate occurs in commerce in the form of fine, white needle-shaped crystals. These crystals contain 43.90 per cent. of water in the form of "water of crystallization." When standing in the air, the water is gradually given off, and dry sulphate of zinc remains. The dry sulphate of zinc, therefore, contains a far greater amount of zinc than the crystallized salt for the reason that its water is being lost, which, of course, increases the zinc percentage. The amount of zinc in the crystallized and dry salts is as follows:

Crystallized Zinc Sulphate.	22.64% Zinc
Dry Zinc Sulphate........	40.37% Zinc

It has been found that the best results are obtained if a solution of zinc sulphate used for electro-galvanizing is well concentrated. It then "throws" better, and the zinc deposits more rapidly with a given voltage on account of the increased conductivity. It will be appreciated, therefore, that if a formula is given for making up an electro-galvanizing solution with zinc sulphate, and the crystallized salt is used, then it will not be the same if the dry salt is employed. It will then contain nearly twice as much zinc. In other words, uniform results cannot be obtained unless the same strength of solution is used, but this can be determined by the use of a hydrometer. It should be known that the crystallized salt, upon exposure to the air, gradually loses its water and becomes converted into the dry sulphate.

The old formula for electro-galvanizing, which calls for 2 lbs. of zinc sulphate dissolved in 1 gallon of water, is insufficient for some purposes, and it is advisable to use a stronger bath. It will, of course, answer if the dry salt is used, but this is not obtained in commerce for the reason that manufacturers of zinc sulphate always desire to sell as much water as possible. It has been found that a solution containing 4 lbs. of the crystallized salt to a gallon of water is preferable. The use of sal-ammoniac for increasing the conductivity and causing the anodes to dissolve more readily is advisable. Some aluminum suphate for producing a smooth deposit should also be employed. The following proportions are recommended:

Water	1 gallon
Zinc Sulphate (crystals)	4 lbs.
Sal-ammoniac	2 oz.
Aluminum Sulphate	4 oz.

This solution will stand between 30 and 40 degrees Beaumé. The sal-ammoniac and the aluminum sulphate should be dissolved in a small quantity of water (preferably hot) and then added to the zinc sulphate solution. If added directly to it, they do not dissolve as readily on account of its concentration. This solution can be used with a low voltage, on account of its high conductivity. From 1 to 2 volts are suitable for the electro-deposition of the zinc. It is used cold. If the zinc sulphate has become dry from standing in the air, then the solution can be made up by adding a less quantity and testing with the hydrometer.

The zinc deposit should be white and smooth, and form rapidly. It will be found that the solution will "throw" into deep places much better than one that is weaker. Some platers have been known to use a saturated solution of zinc sulphate so that some of the salt remains undissolved in the bottom of the tank, but this condition is apt to coat the anodes over if there is a drop in temperature. With 4 lbs. of zinc to the gallon, the solution is very nearly saturated.

*

Bear in Mind that good engineering practice is grounded upon sound theory; and thus remembering, never derogate the fellow whose attainments are strongly theoretical

NEW ONE-PIECE HEATER.

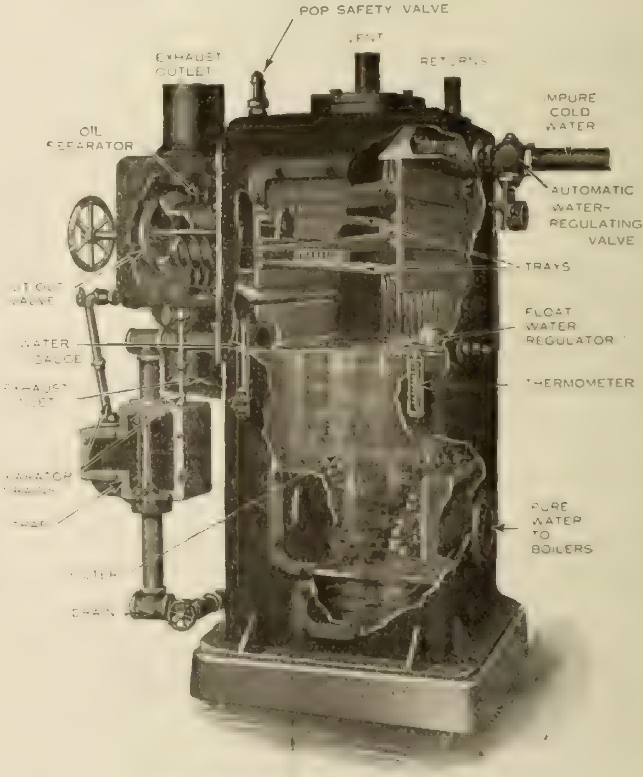
THE Bates Machine Co., Joliet, Ill., have placed on the market a new type Cookson one-piece heater. The substitution of a single casting for the customary built-up plate body does away with bolts and caulked joints at all points save the oil separator, the manhole and handhole covers, and the pipe fittings. In other words, there is no chance for leakage at the points which in any built-up heater are most apt to give trouble from this source. It is evident, too, that the more solid construction is practically indestructible and capable of safety withstanding the greatest back pressure that might ever build up within the heater. The steam space, tray surface and filtering space are large, and four large manholes and handholes make cleaning easy. The cleaning doors are conveniently located in front and back, and as the heater may be made right or left hand, by turning half way round, it will fit into the plant without complications in the piping.

The oil separator is made in either of two types:

(1)—Extra large and with cut-out valve, so that all the exhaust is treated. The surplus over feed water heating requirements is, therefore, in best possible condition for re-use in heating or precessing systems, while the cut-out valve permits shutting off the body of the heater for cleaning, without interfering with the action of the oil separator.

(II)—Standard oil separator which permits piping of the heater on thoroughfare or induction principle, and insures oil elimination from as much exhaust as is required for feed water heating.

A steam trap and return openings are provided so that the heater may receive the returns from a steam heating system or otherwise, as desired. The fittings throughout are high grade, and the flanges are furnished to meet customer's requirements.



NEW ONE PIECE HEATER.

*

It is Very Possible that through the development of this ancient device—the steam turbine—we may yet see the nearest approximation to ideal thermodynamic and mechanical efficiency in the group of heat motors. that man can attain.—Dr. Thurston.

*

INFORMATION FOR INVENTORS.

Pigeon, Pigeon & Davis, patent solicitors, Montreal, report that 126 Canadian Patents were issued for the week ending June 24th, 1913, of which 85 were granted to Americans; 19 to Canadians; 13 to residents of Great Britain and Colonies; and 9 to residents of Foreign countries. Of the Canadians who received Patents, 8 were residents of Ontario; 5 of Nova Scotia; 3 of Saskatchewan; 2 of British Columbia; and 1 of Quebec. In the United States for the same week 580 patents were issued, of which five were granted to Canadian inventors.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

SECTIONAL DIE.

By A. L. Mourad.

WHEN a toolmaker travels from place to place, he notes the different methods used in manufacturing the products of practically the same class of work. Because of the different styles of presses used, one type of press being inclined, while another may be vertical, a punch and die must be designed accordingly.

The drawing shows a very simple sectional punch and die for punching oval washers of .016 inch sheet copper used in armature cores. The same design can also be used for light metal of any description and of different forms. The punch and die are shown separate and in plan and cross section of its centres. The blank must be manufactured very accurately and interchangeable. It is parallel and rounded on both ends; also duplicated by reversing it, either end or sides. The holes also are perforated in exactly the right location.

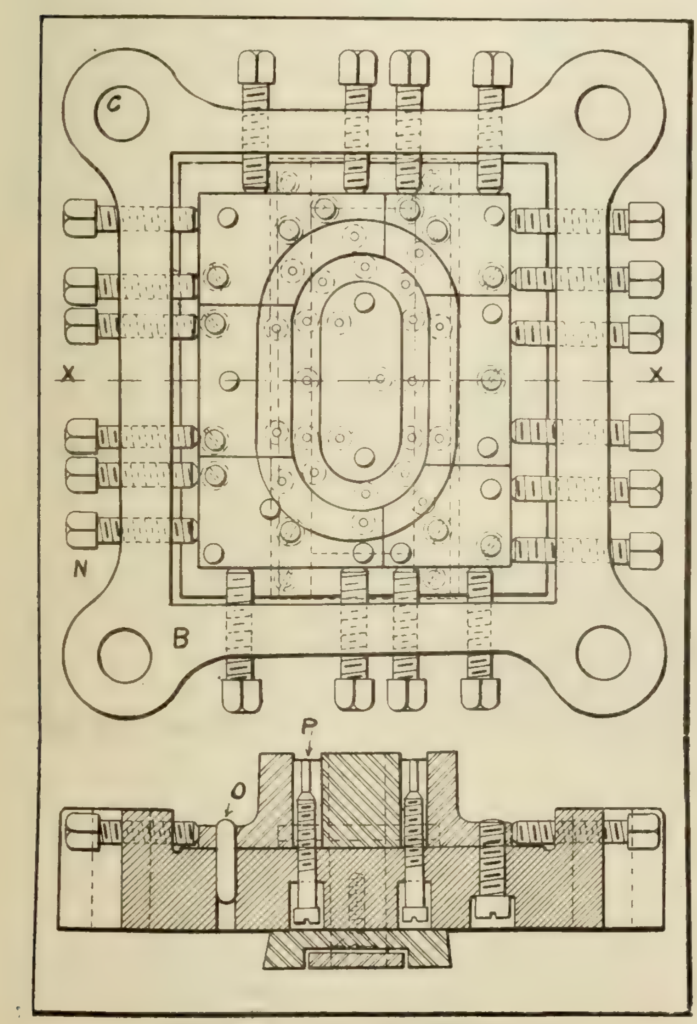
Constructional Features.

In making a die of this nature for thin metal, great care must be exercised and more than ordinary precaution taken in workmanship to have the punch fit the die all over, so as to shut out the light all around, and to cut a clear blank without leaving a burred edge.

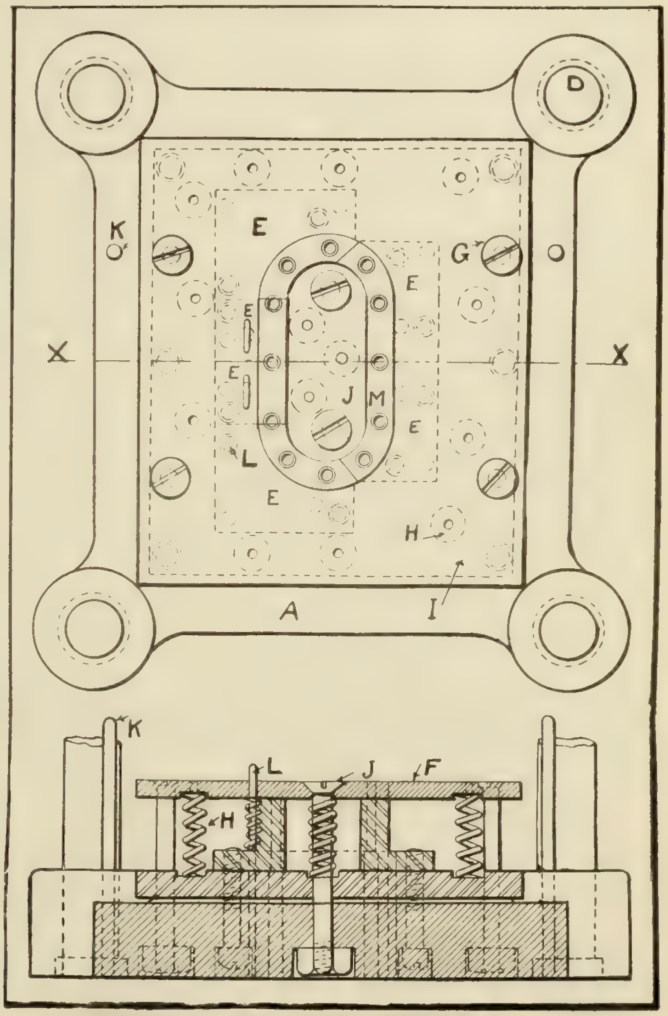
From practical experience it has been found best to harden only one of either the punch or die. If the blank is to be kept continually to a standard size, then we harden the punch and draw it to a very light straw color. As the die begins to wear, it is peened in, on where it is shown to wear, and sheared with the punch again. If the die is hardened, then vice versa. This method should not be adopted where hard or thick metal is used in blanking. The punch and die shown is used in a press of the inclined pattern, with automatic roll feed, the finished work sliding into a receptacle at the rear of the press.

The punch and die holders (A) (B) are made of cast iron and planed parallel bottom and top. They were clamped together and the four sub-press pin holes (C) drilled and reamed at the same time. The punch holder hole is counterbored at the bottom to a driving fit for the sub-press pin D. These pins are made of tool steel, hardened and ground all over. The head end drives in the punch holder, but the other end is a sliding fit in the die holder holes.

Punch sections (E) are made in six parts, and are held with two cap screws and two dowal-pins. After being machined and located, the master templet is used in locating and marking all the pierce holes and the shape of the punch. The punch must, of course, be parallel and square with the sub-press pins. A stripper plate (F) fits close to the



SECTIONAL DIE.—DIE SECTION X.X.



SECTIONAL DIE.—PUNCH SECTION X.X.

punch all over, and is adjusted to the proper height with four flat head screws (C) having a hexagon nut on the bottom, and twelve spiral springs (H). It will be noticed that there is a small hole in the centre of the spring seats, in order to transfer the holes to the bottom plate (I). These are in turn counterbored for a spring seat and in line with the stripper seats. In the centre of the punch is also located a stripper plate (J) fitted snugly to the punch, and held with two flat head screws and three spiral springs. Two guide pins (K) are located one on each side of the punch to keep the metal in parallel position. Two stop pins (L) are located on one side of the punch, with a spiral spring underneath. The punch bushings (M) are driven in, after being first located in the punch from the model templet and then transferred from the punch onto the die.

The die is designed very similarly to the punch and is held from the outside with set screws (N). The faces of the die-section are all relieved to save grinding as far as possible. In this operation, we have the punch on the bed of the press and the die on top. No pilot is used on this die, but the ordinary cam lever feed. The punch and die are used in an inclined press, which causes the punching to fall by gravity after being punched.

The stripping or ejecting device of the punch is made from a solid piece in a similar manner to the punch. There is a flange on the striper (P), 1/4 inch thick, which enters into a recess in the bottom of the die, preventing the ejector from dropping down. No springs are used with this device, it being actuated by a 5/8 inch rod which passes through the die and holder, and is struck by another rod fastened to the gate of the press, thereby forcing out the punching from the upper half.

When this punch and die is assembled we have practically a solid die without any dovetailing. Several of this design have been made, and are giving good satisfaction with regard to durability and accurate work.

DON'TS FOR DRAFTSMEN.

By D. A. Hampson.

WHAT follows, represents the point of view of the man who has to work from the drawings produced in the drafting room.

Don't use sixty-fourths or hundredths of an inch.

Don't depart from the shop standards in the matter of keys, tapers, bolts, threads, etc.

Don't put pattern sizes on drawings for the machine shop except where really necessary.

Don't neglect to give "over all" dimensions on details—the machinist needs them in his business.

Don't forget to mark a surface that is to be ground when there is a possibility of its being finished otherwise.

Don't forget to mark sizes, plus, minus or to give the limits of tolerance or to state running fits on assemblies.

Don't forget that a working centre line does not always divide a figure symmetrically, and that it should be marked C.L. or C|L.

Don't forget to use "light and shade" lines—lines of different widths—when they would assist in the interpretation of a drawing.

Don't send in checked drawings into the shop. If it should ever be necessary to do this, mark them "unchecked" in large letters.

Don't forget that one cross section is often better than two or three elevations.

Don't show a cross section without stating where it is taken, and without stating in what direction it is taken, if there is any chance of error on these two features.

Don't forget that numbering and naming parts is a great help to those who have material to order and to those who assemble.

Don't give dimensions at an angle when it can be avoided—machine tool movements are not built to travel that way.

Don't make all sections lining the same when two or more materials are shown; adopt the generally accepted standard and stick to it. The shop men will then take less time in deciphering a drawing.

Don't fail to keep the shop equipment in mind when designing any extensive work. Slight changes in the design will often keep work in the shop that otherwise would have to be sent elsewhere.

Don't forget that shops are not always as well lighted as drafting rooms, and consequently blueprints with faint lines and many lines crowded together waste much valuable time which should be otherwise employed.

Don't think that it is a waste of time to put the same dimension on twice on a large drawing; the machinist may spend four times that amount tracing the part back to the other end to find the figures.

Don't scorn a sketch in perspective; it is quickly made, appeals to the workman whose education was limited, and for a breakdown job or an experimental one, where the same part will never be needed again, there are points to commend it.

Don't forget that 12 in. d. or 12 in. dia. is better than just 12 in., and is a great help to the men who have to decipher a complicated drawing. The same consideration applies to the marking of radii.

Don't fail to designate by underscoring the figures or otherwise marking them, on any parts which are not drawn to the scale of the drawing. Measuring from a drawing is, of course, forbidden, but occasions do arise when it may be justified, and, again, the sense of proportion is strong in most men and aids materially in the quick reading of a plan.

Don't neglect to put all necessary notes on a drawing. Machinists are not supposed to be mindreaders, and, on work new to the shop especially, notes are of the greatest assistance. An intelligent and judicious use of them makes for the greatest co-operation and good feeling between the drawing room and the shop.

READER, WHAT DO YOU KNOW?

Among readers of Canadian Machinery there is a clearly defined sincerity of desire to know how each overcomes the daily tasks of the machine, pattern and blacksmith shops, the foundry and boiler shops. It is believed that your methods and devices, while good, may be improved, and thereby made more valuable if you publish them, so that other brains may work on them. We will provide the setting and pay you for the material. When your fellow tradesman puts the superstructure on your foundation, we pay him and pass the "kink" on to you, free. Get into the game.

DRILLING CHILLED CAST IRON.

By D. O. Barrett.

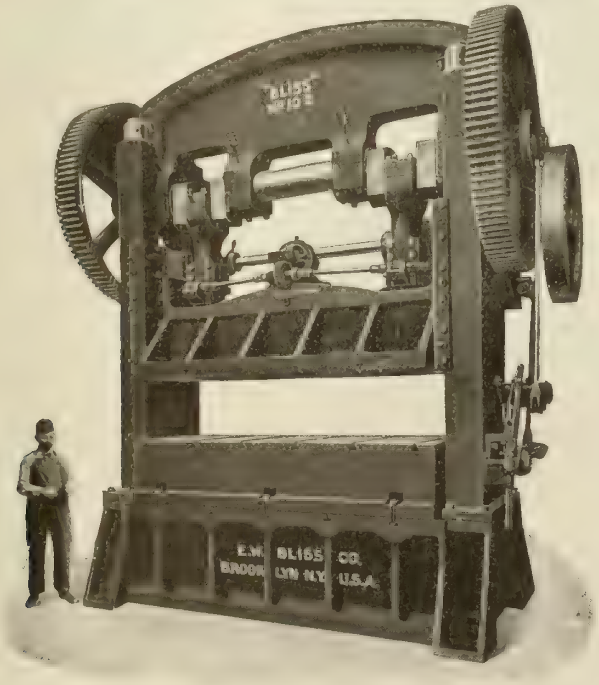
A USEFUL little kink, which often comes in quite handy when drilling cast iron in which hard or chilled spots are likely to occur, consists in heating the piece, or, at least, the hard spot to a red heat, and placing a small piece of sulphur on the spot to be drilled. This procedure will be found to soften the iron sufficient for machining, and is often useful when turning pulleys with thin edges, which are often chilled. These may be heated, and the edges dipped directly in the sulphur.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

LARGE DOUBLE CRANK PRESS.

AN indication of the rapidly increasing tendency towards the use of large presses for producing, from sheet metal, articles which were formerly castings and machine finished, is shown by the size of the double crank press in the accompanying illustration. This press, recently built by the E. W. Bliss Co., Brooklyn, N.Y., is one of the largest of its type built by the firm. It has a height of 19 feet, weighs 190,000 lbs., and exerts a working pressure of 750 tons. Owing to the strain to which the gearings is subjected, the entire train of gears consists of steel castings, machine cut out from the solid; the ratio of gearing being 38 to 1. The crank shaft which operates the slide has a stroke of 16 inches, and is made from a 50 point carbon, open hearth hammered steel forging, and to avoid all torsional strain when working, it is twin driven, arranged with a main driving gear on each end. The driving pinion on the intermediate shaft which imparts motion to the main gears is placed centrally on the intermediate shaft, thereby overcoming any torsion on this shaft.



BLISS LARGE DOUBLE CRANK PRESS WITH SPECIAL AUTOMATIC STOP FEATURE.

The slide, the area of the face of which is 56 inches front and back, by 118 inches right and left, is adjusted by an independent electric motor fitted with a jaw clutch for starting and stopping. The motor is placed on the top of the slide, and operates through universal joint connections to the multiple thread worms on the main connections. Both connections are adjusted in unison, and alignments of the faces of the slide and bed is maintained in correct relation to each other. The counter balance of the slide is by counterweights placed on the main driving gears. The distance from the bed to the lower face of the slide, stroke and adjustment up, is 64 inches, adapting the press for dies of considerable height; when shallow dies are to be operated, bridge bolsters are used. The machine is controlled by a hand actuated powerful friction clutch of the double grip type. The clutch is arranged with an automatic device which automatically stops the press on the top centre, and which in addition permits of starting and stopping the moving parts at any point of the stroke independent of the automatic stop, giving the combined advantages of a positive automatic stop on the top centre, and absolute control over the moving parts at any point of the stroke.

Control of the device which in turn controls the friction clutch is by means of a spring handle attached to the shifter handle, and which spring handle operates on a pin clutch. The pin clutch being operated direct from the shifter handle allows the operator to start the moving parts at any part of the stroke, independent of the automatic feature for stopping the press on the top centre. The pin clutch can by a small lock attached to the shifter handle be locked so that the press may be run continuously.

Te above mentioned automatic stop device is located on the lower part of the right hand upright, and is actuated from the crank shaft by means of connecting rod, crank dise, rack and pinion. The automatic stop feature operates on the up-stroke of the crank shaft, when the pinion engages with the pin clutch connected to the rocker shaft, to which are keyed the levers for operating the friction clutch. Another advantage in connection with this special feature of the press is that the latter cannot be set in motion by any accidental pressure against the shifter arm, as it is first necessary to operate the spring handle before the press can be set in motion.

The bearings of the back shafts, friction clutch and loose pulley are bronze bushel and the bushings have babbitt with graphite cast in them to aid lubrication. To avoid possible damage to the press by excessive pressure, the flywheel is arranged with a safety coupling. Some of the dimensions which may be of interest are noted below:

Area of bed 60 in. F & B x 126 in. R. & L.

Floor space 122 in. F. & B. x 215 in. R. & L.

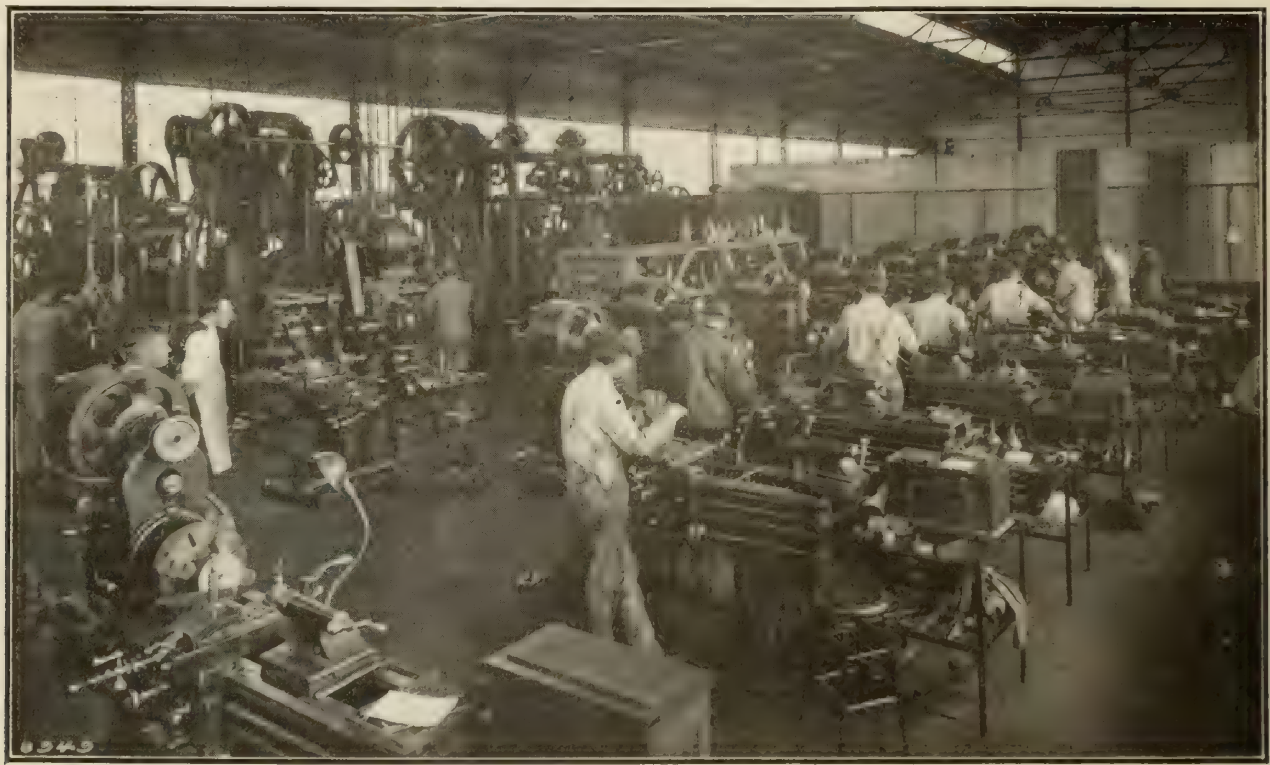
Flywheel 60 in. diameter x 8 in. face. Weight 2,400 lbs.

THE MARK COLD DRAWN STEEL UNION.

THE Mark Manufacturing Co. of Chicago are putting on the market a pipe union, which presents some new features. This union differs from others in that it is made of cold drawn steel throughout. A new plant has been recently added to the firm's Evanston pipe mill, for the express purpose of producing this particular specialty.

Cold Drawing Process.

These cold drawn pipe unions are made from flat strip steel by the cold



INTERIOR OF THE SHOP WHERE "MARK" UNIONS ARE MADE.

drawing process, making a fitting that is of course seamless and free from sand holes, pin holes, or similar structural defects. By the use of steel a very strong union is, of course, secured. The successive drawing operations are performed in a series of punch presses, ranging in weight up to over 100 tons, and individually driven by motors, ranging from 5 to 150 horse power. All of the dies for the new unions are constructed in a tool room, built and equipped for that purpose. This tool room is an interesting example of the application of individual motor drive, as all the lathes, shapers, automatic grinders, milling machines and other tools are driven by individual variable speed motors.

The plant includes a Sherardizing furnace for rendering the unions immune from rust and corrosion. The Sherardizing process is one which most engineers are thoroughly familiar with, and consists of heating the article to be Sherardized together with zinc dust in drums or retorts, which causes the zinc to penetrate a short way into the metal, and also leaves a coating. This method has proved to be the most satisfactory one yet found for rust-proofing threaded articles.

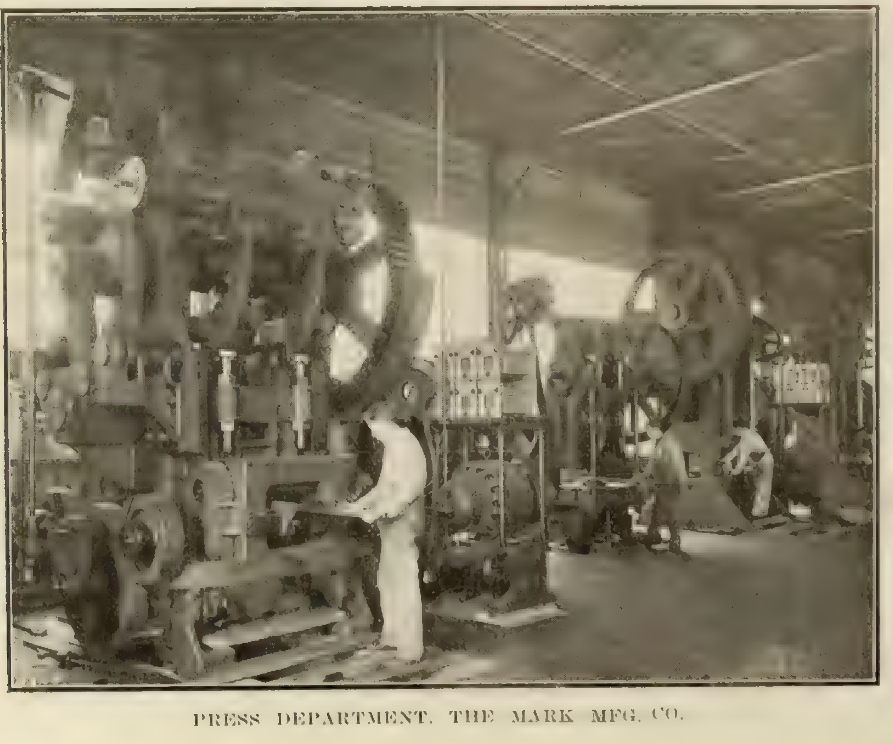
Building Feature.

The building in which this industry is carried on is naturally interesting, as practically all the latest methods and practice in fireproof building construction have been employed. A steel sash runs from about three feet above the floor almost to the eaves. The floor is paved with creosoted wood blocks, and the roof is covered with concrete tiles. The result is a well lighted, well ventilated building, free from interior columns, and well adapted for the purpose intended. The main building is 75 ft. x 200 ft., with a wing 70 ft. x 150 ft.

Process of Manufacture.

The Marks Seamless Cold Drawn Steel Union consists of the usual three main parts, male and female ends, joined by a coupling nut. All of these parts, as well as the brass seat ring, are drawn cold from flat stock, each piece being subjected to a series of operations, of which we illustrate four stages in the manufacture of the male member.

The manufacture, as before stated, starts with long steel strips, from which discs or blanks are cut. These discs are then drawn into a deep cup, from which the bottoms are punched, forming a cylinder as shown in the sec-



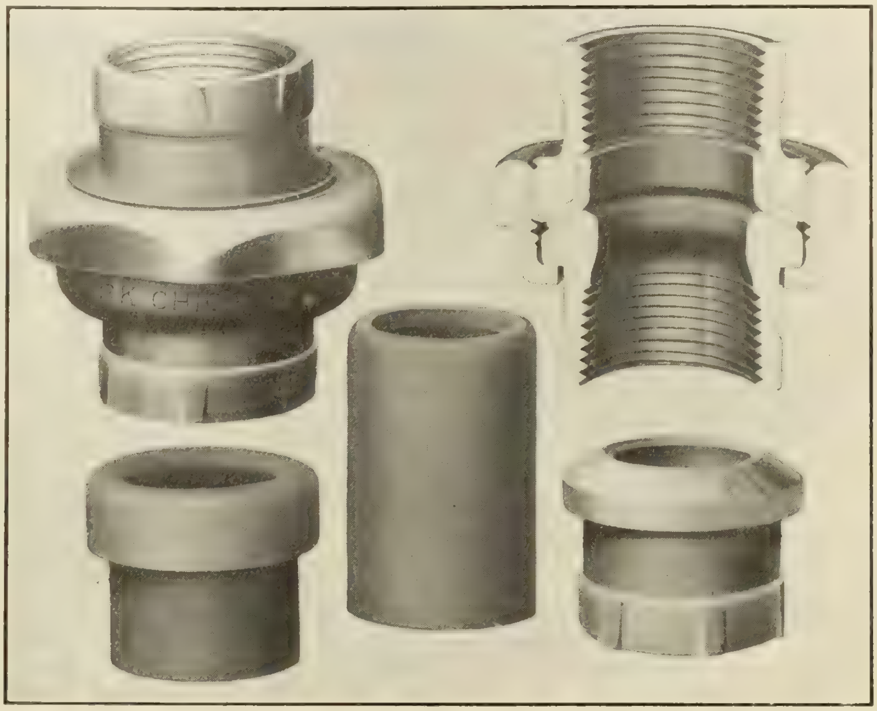
PRESS DEPARTMENT. THE MARK MFG. CO.

ond cut. One end of this tube is then folded or rolled back upon itself to form a reinforcement, which the succeeding operations press into final shape. The lower end is upset to form the bead, and the part is ready for threading. The union is threaded to Briggs Standard for pipe threads, and so carries the same taper as the pipe. The material, high grade steel, is free from flaws, such as sand holes and kindred unseen defects commonly found in unions of a cast metal.

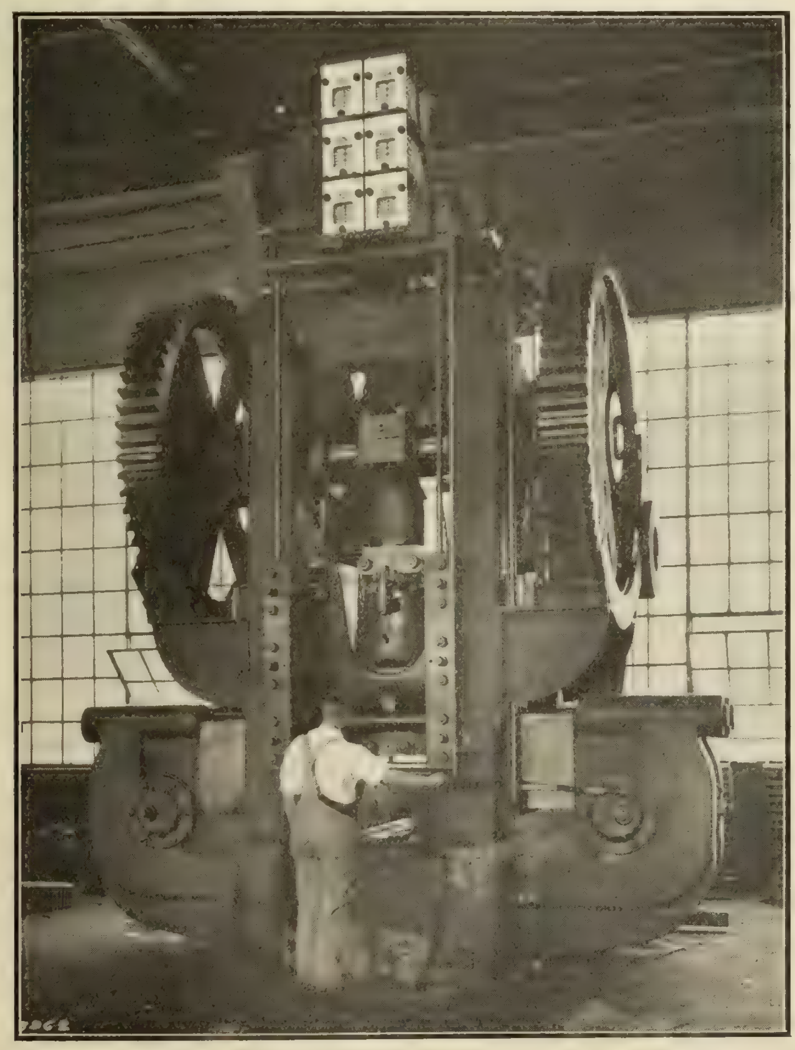
Another advantage of the Mark Union is that it is made of the same material used in wrought steel pipe. The expansion of steel unions under heat is the same as the expansion of the pipe, and the contraction when cooled is also the same. Under all conditions of temperature the steel union retains its tight grip on the pipe unchanged.

The Seat Feature.

Another novelty in the Mark Union is the densified, hardened steel seat, which is opposed to a very soft brass ring in the female end. This densified seat is formed by applying the die with such tremendous pressure that the metal is actually hardened. In this operation the pressure alone gives the seat a smooth, accurately shaped and polished surface. This seat engages the face of a ring drawn cold from dead soft brass, and annealed after drawing to keep it soft. When the coupling nut is screwed into place firmly, the densified steel seat makes, with the soft brass ring, a joint so effective as to be leak-proof under extreme pressures. Contributing to this feature is the fact that both the steel seat and brass ring are formed in dies without machining or grinding, and the fit of one face against the other is exact.



DETAIL OF THE "MARK" COLD DRAWN STEEL UNION.



A LARGE PRESS EMPLOYED IN THE MANUFACTURE OF "MARK" UNIONS.

The Sherardizing Feature.

Rust and corrosion are provided against in the Mark Union by putting every union through the Sherardizing process, which forms a zinc alloy, integral with the body of the metal over every part of the surface. This Sherardizing is done after the threads are cut, and protects them fully from corrosion, without altering in the slightest degree their sharpness and fit.

* * *

Electro-galvanizing is now extensively used in a large variety of trades. For many purposes it has proved superior to hot galvanizing, and in others has replaced nickel or copper plating. It has now become a well established fact that a zinc coating upon iron or steel is the best rust preventitive known.

Sense and Wit.—There are fifty men of wit for one of sense. He who carries about him nothing but gold will often be at a loss for want of change.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

THE PRODUCTION OF MALLEABLE CASTINGS.

By Dr. Richard Moldenke.

THE malleable casting is a very peculiar one. It has a place among iron products that is particularly unique. It is the only form of cast iron that we know of, in which, by the application of heat treatment, there is an absolute change from bad to good, or from a useless condition to a highly useful one. The malleable casting as it was known in the early part of the 18th century is the same casting as it is today; we have only fixed the underlying principles of the process, and know more about why things are done now than they did then. All attempts to change the making of malleable castings have failed; but we are learning how to make it more uniform.

A United States Product.

The malleable casting is a distinct product of the United States. Whereas, I presume, the entire production of malleable castings in the civilized world outside of the United States and Canada, may be placed at seventy-five thousand tons per annum, the capacity of this country is at least a million tons a year, and we probably make something like nine hundred thousand. This is a fairly large business when compared with the balance of the iron and steel industry, for the ordinary gray iron foundry output is about eight million tons a year. We are, therefore, dealing with something that has a very important place in the political economy of the country.

I have frequent requests from individuals and manufacturing concerns for information which will enable them to start in the malleable iron casting business, but I advise them to keep out unless they really have the right market conditions. Otherwise it would prove a rather costly experience. The producing capacity of the country grows with the demand, and anyone who goes into this business, without knowing just what the demand is, has got very serious times ahead af him.

A further difference between the malleable casting industry and that of the ordinary grey iron is that the plant is at least four times as costly; hence the "overhead" expense is to be reckoned with carefully. Moreover, the running capital must also be ample, as the "turn over" of the material is far slower than in the case of gray iron castings.

Classes of Malleable Castings.

Réaumur, the French chemist, described the first malleable iron that we know of in 1722; and that casting is today made in Germany, France and England as it was made then. There are two general classes of the malleable casting. The practice in America, and partly also in England now, is to make these castings with the so-called "black heart." If you fracture an American casting you will see that the interior is entirely white. In other words, the carbon of the European casting has been almost entirely removed, whereas the carbon in the interior of the American casting is nearly all there. There has been a conversion of the combined form of carbon to the so-called "temper-carbon."

Seth Boyden, of Newark, N.J., was the earliest manufacturer of malleable castings in the United States. It was probably introduced here from England. He experimented considerably, and left us a record of his work. Seth Boyden simply had to repeat the work of those who went before him, but he tried to learn for himself why those castings were made in that way. Probably a very costly business; because no man could illuminate the subject even if he would.

Malleable Casting Characteristics.

The most striking characteristic of the malleable casting is the remarkable resistance to shock. If you could see right through the structure, you would find that it is nothing more than a network, or an aggregation of crystals of steel with flakes of lamp-black between them. In other words, if you analyze the annealed casting, you would find the total carbon, say 3.75; made up of perhaps 0.40 combined carbon and all the rest graphitic carbon. Of course, silicon, manganese, phosphorus and sulphur are additional. The combined carbon is in crystals of iron, making them a 0.40 carbon steel; the graphite is there mechanically mixed between the crystals.

In the original hard white casting, the carbon is all in the combined form, but in the annealing process this is changed from the combined to the uncombined, amorphous graphitic state. If the skin of such an annealed casting is taken away, the interior portion will be found to contain the full amount of carbon changed, not to crystallized graphite, which pulls apart easily, but to an amorphous form appearing under the microscope like lampblack. As a consequence, when it comes to shock resistance, owing to the fact that the graphite is not crystallized in "malleable," you can batter it to pieces at one end, and the other will remain perfect.

In my early experience along this line, I cut coupons from scrap couplers of all shapes and kinds; and have taken them from couplers that had been in service a long time and come back worn out. I did the same with steel couplers; and the results indicated that whereas the malleable coupler invariably—if the iron was a good, proper malleable casting to begin with—showed up good metal, the steel coupler did not always do so. It seemed to me from these tests, that in a long steel casting, subjected to the streses of railroad service, the face would begin to open, the crystals going apart; while in the malleable they crush together, the amorphous graphite acting as a cushion. In steel, the opening up of the crystalline structure would go on long enough to eventually ruin the casting.

The other explanation would be that these steel castings may not have been properly annealed; and that they had casting strains which reduced their strength. The malleable casting is the best to use for railway service where extreme strength in tension is not essential.

The Strength Feature.

A good malleable casting ought to stand about 45,000 pounds to the square inch. I have made them as high as 63,000 pounds to the square inch, but would not recommend that for every-day work. When we go into high tensile strengths for "malleable," we begin to reduce the shock-resisting and twisting qualities. I think that the great mistake being made to-day by purchasers of malleable castings is that they ask too much tensile strength of the malleable casting. It would be far wiser for them to go to the steel casting at once, because, in trying to get a very high strength, they must sacrifice the qualities of ductility, softness, etc. The ordinary, normal malleable casting without steel additions in the mixture runs about 35,000 pounds to the square inch, and when we begin to add a little steel scrap, it will run to 45,000, or even up to 51,000 lbs. per square in. I have made about 80,000 tests on a "malleable," and the monthly average of the test bars started with 35,000 pounds to the square inch when I began the work, and the average of all of them, when I finished up, was about 51,000 pounds to the square inch.

In the malleable casting we deal with a material which has passed through a special heat treatment. It is hard to start with, and when it is annealed it is soft; hence we can safely use a square bar. This is broken in the middle for the transverse strength, and pulled in the testing machine for tensile strength. We deal with an iron that contains about 0.65 silicon, hence there is a very large interior shrinkage in the metal apart from the contraction of the casting itself. This averages a quarter inch to the foot. Furthermore, the iron sets very quickly, and the consequence is that when you pour a long bar, 13 to 15 inches long, the metal touching the sand sets first, and you have a liquid interior for a short space of time. Next, the gate cuts off with the interior of the bar still liquid. then this begins to set, and it shirnks and pulls apart inside.

The interior of a malleable casting, or of any casting, is therefore filled with a whole lot of planes of separation. When you put a piece into the testing machine, you will invariably find that the fracture shows up the interior shrinkage; there is a little bad spot in the centre, and it will always break at the weakest of these spots. I have repeatedly taken bars which had broken very close to the grip, put them in the machine again, and if they would break at the end again, I tried them the third time.

The first time the bar may be broken at 42,000 pounds, next at 48,000 pounds; and the third time at 54,000 pounds. It is simply a case of breaking first at the worst of these spots; then at a less bad one; and then the least bad one. The consequence is that, the test is better square than round, for the reason that in a square bar you get proportionally very much more sound material than in the round one; hence for malleable castings, you must never use a round test bar. If intricate castings are to be made, the design should suit this tendency to heavy shrinkage. They should be made so that there are no sharp corners nor very sudden changes from small to large section, because, in the large portion, there will be found a heavy shrinkage spot by the gate cutting off before feeding is complete.

Casting Structure.

To go into the structure of the casting itself:—The hard casting (before it is annealed) is of the same composition throughout. Analyze the interior or the skin, and you will find the same composition. After the annealing, it is different. In the annealing, there is a change from the combined carbon to the amorphous "temper carbon," and also the removal of some carbon from the casting surface. In European malleable castings, the removal continues through, as these are always thin and small, and are annealed at higher temperatures. On of an inch off, and you find ature is just high enough to permit this carbon conversion and no more. Plane off the skin and in it you find 0.20 carbon; plane the next sixteenth 0.65; another sixteenth off, 1.50; and in the centre, perhaps 3.25, or whatever the total carbon in the hard casting may have been.

If you take a malleable wedge, put it in the fire, make red hot, plunge and quench it, you can file the very thin edge. If you go through this skin, you strike 1.50 carbon. There you have tool steel which will not file away. Further back, grinding through this hard portion, you get the interior softness again. If you try to straighten a malleable casting by making it red hot you are liable to produce this very thing, and there is a chance for the reconversion of the amorphous graphite or "temper carbon" back into combined carbon again. An instance of this in point:—

We had a rush order for a lot of guard plates, I think ⅝-inch thick—and they came out of the anneal badly bent. The best thing was to try to straighten them cold, there being no time to straighten them hot, and put them back into the anneal again. These plates were in the blacksmith's fire and straightend. Every one of them came back from service with the heated part broken off. The portion which had been heated and hammered was steely and white, and the portion not heated was nice and black. Here, was that change of the uncombined carbon to the combined, which goes to show how sensitive the malleable casting is to heat treatment. Straightening should be done cold.

An excellent service test of the malleable casting is the placing of test lugs on castings, and trying to make them about the same thickness as the casting. They are broken off to see if the fracture indicates good material. Foundrymen do not like to leave them on for the inspection of their customers. From the standpoint of the customer, they should be available. In important work, however, it is well to have these lugs in several locations, so that they could be broken off afterwards in order to have assurance that the casting was properly annealed before it was sent out.

As far as pattern work is concerned, there is very little to say more than that the malleable casting is naturally made very thin and ribbed, as a rule, because by reason of its strength it replaces a gray casting perhaps twice or three times as thick. The malleable casting, is essentially repetition work. I have often received in our works orders for 65,000 to 100,000 pieces of one kind. It is rather nice work, because of requiring enormous quantities; hence, the molding machine has a good place in the malleable shop, and it is beginning to get there. The permanent, that is the iron mold will find in the malleable casting shop perhaps its best application. So far there has not been much done in this line yet, but it is bound to come.

There are very few castings made in the malleable business that are not cored out. The very use of a strong, light malleable casting to replace gray iron means core work, so that the core room is a very important department in the malleable shop.

Process of Manufacture.

We come to the process. These are the crucible, cupola, Bessemer converter, air furnace, open hearth, and electric. The crucible process makes the finest malleable as it does the finest steel, with the exception of the electric furnace—a comparatively new development. It is expensive, however, and consequently you will find the crucible made casting only in Europe, where the malleable casting is more expensive than the steel casting. To show the differences in practice between Europe and this country, I will mention that I had to do with the designing of one of the largest European malleable plants. They made American malleable castings in it up untli two years ago. Then they had to give up making the American malleable casting for the reason that in Europe they machine their malleable castings.

The last thing to do with the American "black heart" malleable casting is to machine it. The skin is the strongest portion of the malleable casting, although it does not follow that the interior is not good, because I have often, to satisfy myself, taken a malleable casting, planed off all the decarbonized portions and tested the interior; and where I found that the casting itself would stand about 43,000 to 48,000 pounds to the square inch, the interior portion alone stood about 42,000 pounds to the square inch. In Europe, they take their malleable casting, turn it and finish it; as they do nearly all their work, and as the interior shrinkage naturally bothered them, they had to go back to the European decarbonization method to succeed.

WHY COLLEGE-BRED MEN OFTEN FAIL.

IT is late in the day for a writer in an English contemporary to venture the assertion that a technical school training should come after shop experience, and not before, as is usually the case. Attempts are being made in some large American cities, Cincinnati in particular, to introduce the Sandwich system, i.e., arranging for youths to spend part of their week at college, and the remainder in some large shops in the vicinity. This is an improvement on the old system, but we are of opinion that a boy should be sent straight from high school to the shops, and to college only after he has received a thorough training in every branch of the trade.

It is often noted that the most brilliant men in engineering colleges are those who have been sent to work at an early age to earn their own living, and have won scholarships for universities after hard night work. Once these men get hold of the elements of mathematics and chemistry, with a little ability as draughtsmen, nothing can compare with them. The putting of the theoretical and the practical together is to them a most natural process. With the boy at college it is different. He may never have been in a machine shop or foundry before in his life, and probably there are those in the same class who have spent several years in the shops, or who played in them as boys. The result is that the instructors have a tendency to take too much for granted, and a portion of the boys go through college looking upon machine tools, steam engines and electric motors as mysterious animals, who perform certain functions, but they never know why. There are some instructors in colleges who become attached to students who have an unusual knowledge of their work, and will carry on long arguments in class, while the others look on and listen to this strange lingo, not daring to say anything for fear of revealing their ignorance.

The writer referred to above, objects to colleges carrying out work for manufacturing firms, claiming that no college can turn out men competent to do this work. He is quite right in this, and even the practice of building machinery in colleges to be used later by the students, is wrong as sometimes carried out. As a rule the average class in an engineering college is the most diversified bunch imaginable. There is the little fellow half way through his teens, who has never learned to use a file. There is the boy past twenty who knows as much as the instructor; and there is the engineer's son, who knows machinery, but lacks the principles. This is the class which starts out to build a gas engine say, the castings and drawing of which have been supplied by a local firm. The boys who begin with the file, will get the filing to do, the harder machine work being done by the more experienced lads, and by the instructor himself. It would be foolish ever to expect a college to turn out machinery under commercial conditions. It usually takes the boys several years to make a machine, the work passing from one generation to another.

After all, it is the parent who requires the advice, and he cannot be reached through the columns of an engineering journal. He fondly desires that his son be an engineer and, having the money, he sends him to a college, not wishing him to be as other boys are. When the boy comes out of college, he must either descend to the shops at the foot of the ladder, or, unless he is quite brilliant, he will be a failure.

◆

If the manufacturer esteems intelligent, high-grade employees with peace and contentment in his works, he will strive to carry out a program which includes good wages, fair terms, and freehold homes for his people. Manufacturers are responsible to their associates, their stockholders and the world at large, not only for the successful conduct of the industrial institutions, but in a higher way they are responsible for their standing before the public in the light of honest, just men who recognize certain Divine principles in the management of this great world, and who stand steadfast as a rock for the carrying out of these principles—justice, integrity and humanity.—C. W. Post.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, July 14, 1913.—A waiting attitude still characterizes the machinery equipment, iron, steel and metal markets. There is no decided tendency either way, a feature, in itself, not without encouragement. Orders on hand are still of sufficient volume in most industrial and manufacturing establishments, to warrant an optimistic forecast of the near future, and with latest crop advices favorable and other conditions generally sound, we look for a renewal of demand from consumers of mechanical engineering products. Copper has been somewhat lower to-day than during the past two weeks, while antimony and spelter show no change. Tin shows an advance over last prices, but activity is in no sense marked. Copper is a trifle lower than reported a week ago.

Toronto, July 15th, 1913.—Conditions in the machinery and metal market are inclined to be quiet, although in some lines the demand has been better than might be expected. The A. R. Williams Machinery Co. report a fair demand for machine tools with future prospects looking more favorable. There is also a pretty fair demand for electrical equipment, some interesting specifications having been received. The demand for wood-working machinery is slack at present, but better things are expected later in the season. The Canadian Fairbanks Co. also report a fair demand for machine tools with business in other departments steady. Prices in the metal market are practically stationary, and business as a rule is quiet. United States and British Mills are very busy and so it is still difficult to get good deliveries. Pig iron market is dull, with little change in prices. The demand for tool steel is good, several nice orders having been placed recently.

* * *

AMERICA'S FIRST SAFETY EXPOSITION.

THE First International Exposition of Safety and Sanitation ever held in America will take place in New York City on December 11th, to 20th, 1913, under the auspices of The American Museum of Safety. Safety and health in every branch of American industrial life, manufacturing, trade, transportation on land and sea, business, engineering, in all of their sub-divisions will be represented at this Exposition. It will be the first step toward making a representative exhibition of the progress of safety and preventive methods in America.

There will be absolutely no limit to the scope of the Exposition, as it will embrace everything devoted to safety, health, sanitation, accident prevention, welfare, and the advancement of the science of industry.

By a special Act of Congress, exhibits from Europe and other foreign countries are to be admitted free of duty. European employers have cut their accident and death rate in half by a persistent campaign for safety. There are 21 Museums of Safety in Europe. All of these various Museums will contribute to the American Exposition.

In the United States, every year, 40,000 workers are killed, and 2,000,000 are injured, while 3,000,000 are ill from preventable causes. A conservative estimate of the wasted wage earning capacity of the latter for one year is four hundred million dollars. Thus, it can be seen what this continent has to accomplish in the way of conserving human resources. The main object of the First International Exposition of Safety and Sanitation is to point the way.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Toronto, Ont.—The Perolin Co. of Canada will erect a factory at Toronto.

Weston, Ont.—The Moffat Stove Co. has awarded the contract for a three-storey foundry and nickel plating shop to cost $25,000.

Revelstoke, B. C.—A foundry for the manufacture of cast iron stoves and heaters, as well as for brass and iron castings, is to be located here and will be ready for operation in the fall.

Prince Albert, Sask.—It is reported that a new industry will be started here for the manufacture of horse shoes, steel castings, sheets and bars, etc. J. J. Kreis, of Pittsburg, is representing the syndicate behind the venture.

Bridgeburg, Ont.—The Canadian plant of the Chicago Bridge & Iron Works Company, at Bridgeburg, Ont. (opposite Buffalo), is nearing completion and its operation will be commenced as soon as the equipment is installed.

Calgary, Alta.—The Northwestern Brass Co. has awarded the contract to Westinghouse, Church, Kerr & Co., New York City, for the construction of a foundry building 100 x 200 feet, with a wing 40 x 73 feet. The plans have been prepared by the A. B. Baker Engineering & Appraisal Co., Buffalo, N. Y. Reinforced concrete will be used throughout.

Hamilton, Ont.—The Dominion Steel Foundries Co., which was formed to take over the Hamilton Malleable Iron Co. and the Dominion Steel Castings Co., have purchased 3¾ acres adjoining the plant of the Dominion Steel Castings Co., and will shortly commence to build a new plant. Prack and Perrine, 36 James Street, Hamilton, Ont., are architects and engineers.

Galt, Ont.—President George A. Dobbie, of the Board of Trade, has verified the reports from Boston that the B. F. Sturtevant Company intended to establish a Canadian branch here. He stated that the agreement had been signed for the United States concern to start operations about August 1, with fifty or sixty hands, in the factory recently occupied by Canadian Motors, Limited. They have taken three and a half acres on the southern sub-division of Galt Lands, Limited, and will increase their holdings to six acres.

Electrical

Welland, Ont., will engage an electrical wire inspector, who will also be employed by other towns and cities in the district.

Merritt, B. C.—The town council is planning to extend the power plant. A second 125 kw. unit, three-phase, 60 cycles, 2,300 volts, will be installed.

Peterboro, Ont.—The city is now having valuations made of the plant and distribution system of the Peterboro Light & Power Co. with a view to taking it over.

Burnaby, B. C.—The British Columbia Telephone Co. will place aerial cables, poles and wires in Edmonds and the Burnaby lake district. An estimate for the whole of the Collingwood territory is in hand.

Welland, Ont.—The Niagara, Welland and Lake Erie Railway Co., who have operated a mile of electric railway in Welland for a year or more, are laying tracks for a half mile extension in Welland.

Coaticook, Que.—Tenders for an iron penstock for the upper dam of the

Refrigeration.

Creamery & Cold Storage Co., Medicine Hat.

Civic Electric Light Station were called for recently, and three were submitted by Sherbrooke firms. The prices were so high that the council ordered the old one to be rebuilt with wood.

Toronto, Ont.—The Hydro-Electric System will erect a $1,000,000 reserve auxiliary plant for the supply of power to the water works, etc. This enterprise has now the approval of both local and Government bodies. W. Ellis is chairman of the Commission.

Sidney, C.B.—It is reported that Newcastle is to be the Atlantic terminus of the Universal Radio Syndicate, who are proposing to establish an All-British wireless telegraph system round the world. The syndicate controls the Poulson and Dudel patents.

Vancouver, B. C.—The British Columbia Electrical Railway, Vancouver, is having plans prepared for the construction of shops at Burnaby, B. C. These will consist of a machine shop, blacksmith shop, wheel shop and store house in a combination building 70 x 355 feet, machine shop, 70 x 160 feet, stripping and erecting shop with 10 pits, wash and wheel shop, 65 x 120 feet, storehouse 35 x 130 feet and a paint, erecting, wood working, cabinet, door and sash varnishing building, 130 x 330 feet. In this latter building is included oil and paint storage basement and oil serving equipment. All the buildings will be of structural steel with concrete foundations, brick walls and wood roof. The company is also planning the construction of a double deck car barn in Vancouver. The first floor will be 130 x 350 feet and the second floor 130 x 300 feet. The barn will contain a small machine shop and store room, oil room and sand apparatus. Other construction planned is a car barn, 105 x 300 feet, at North Vancouver and a barn and shops at Victoria, B. C. Westinghouse, Church, Kerr & Co., New York, are the engineers for all this work.

Municipal

Toronto, Ont.—The city is contemplating the elimination of all horses from its fire department, substituting motors.

Kerrisdale, Pt. Grey, B.C.—On June 23rd, the ratepayers passed three by-laws, including one to purchase water and sewerage systems at Shaughnessy Heights, and an incinerator.

Edmonton, Alta. — The Wabamun Power and Coal Company, Limited, have submitted a proposition to the City Council in which they offer to supply the city with electricity at $1.22 per k.w. as against $1.98 which is the price the city are paying at present. The company have large coal areas near Wabamun Lake where the power plant will be located.

Calgary, Alta.—It is proposed to erect a municipal building in the near future. The plans call for a modern factory building of eight or ten storeys in which space is to be leased for small industries. The new structure will contain every facilitiy for the small manufacturer, the cost being estimated at $250,000.

B. F. STURTEVANT PLANT FOR GALT, ONT.

Governor Eugene Foss came out with a statement on July 13 condemning the U. S. Democratic Congress for its tariff legislation, and announcing in the future he would do the greater part of his machinery manufacturing in Canada. This statement followed the announcement that the B. F. Sturtevant Co., the concern which the Governor controls, had purchased the factory of the Canadian Motors Co. at Galt, Ont. The Governor's statement in part is as follows: "For more than twelve years one of the principal Massachusetts corporations which I represent has had under consideration the scheme of transferring to Canada a large portion of its work. I have personally opposed this plan, and have endeavored to maintain this industrial enterprise in full here in Massachusetts, but am now convinced that it is no longer possible to defer action on this matter. Accordingly, I make the announcement, although I do so with sincere regret, that the B. F. Sturtevant Co. has just completed the purchase of a manufacturing plant in Galt, Ont., and that a large part of the work which has hitherto been done at Hyde Park will now be transferred to Canada, the refuge.

Port Dalhousie, Ont.—The town is looking forward to extensive municipal improvements in the near future. A Toronto engineer, engaged by the local council, has planned a system of waterworks and sewerage that will cost $150,000. The waterworks scheme will probably be placed before the ratepayers in 1914. The installation of a system would necessitate the construction of a standpipe and the pumping of water out of Lake Ontario.

General Industrial

Rosebank, Man.—The Northern Eleator Co.'s elevator at Rosebank, Man., was destroyed by fire last week.

Medicine Hat, Alta.—A company has agreed to build a creamery and cold storage plant here. It will cost $50,000.

Medicine Hat, Alta.—John H. Tabor, of Lethbridge, will probably build a $25,000 factory here, employing 200 hands.

North Battleford, Sask.—Ruggles, Winters & Huntington are installing a plant for the manufacture of patent facing bricks.

Estevan, Sask.—The Great West Coal & Brick Co. will spend $87,000 on new machinery. The president of the company is J. A. Kinney, barrister, Kenora, Ont.

Medicine Hat, Alta.—John H. Tabor, of Lethbridge, has deposited a $500 cheque with the city as evidence of good faith that he wil build a $25,000 factory, employing 200 hands.

Victoria, B. C.—A plant will be erected on Madge Island by the Capital Shale Face Brick Co., which is capitalized at $100,000, and is being promoted by M. T. Bond, of Litchfield, Eng.

Listowel, Ont.—It is reported that Mr. Max. Becker, of Toronto, has sesured a lease on the Bender building, and purposes using it for the establishment of a knitting factory, which will employ possibly from fifteen to twenty-five hands.

Port Coquitlam, B.C.—The C. P. R. have commenced construction work on a new oil station here, which will be the receiving station for a pipe line running from Port Moody. The oil will be brought by ships to Port Moody and pumped to this city for use in the railway yards of the company.

Niagara Falls, Ont.—The American Cyanamid Co. is planning the erection of an extensive plant which will be of structural steel and reinforced concrete and tile brick construction. The plant will consist of the following buildings: Carbide building, 110 x 144 feet; cyanamid building, 91 x 390 feet; hydrating and granulating building, 110 x 220 feet; cooling building, 85 x 110 feet; raw material bins, 26 x 53 feet; wash house, 40 x 97 feet; office building, 31 x 81 feet; laboratory, 31 x 81 feet; liquid air building, 60 x 120 feet; store house, 40 x 80 feet; coke dryer building, 32 x 81 feet; and miscellaneous buildings. Lime nitrogen silos, 56 x 56 feet and lime kiln building 50 x 115 feet. The plant will be fitted with electrical equipment. Westinghouse, Church, Kerr & Co., New York City, have been commissioned to design and build the plant.

Wood-Working

Wm. Rutherford and J. Merriam, Medicine Hat, Alta., will spend $15,000 on woodworking machinery.

The Bridges Lumber Co., Fort Steel, B. C., is erecting a saw mill on the Kootenay River, which will have a capacity of 45,000 ft. per day.

Saint Cajetan d'Arnagh, Que.—On July 9 fire destroyed the saw mill of Mr. Fortunas Pouliot, and a large quantity of lumber. The loss is $5,000.

Scott's Junction, Que.—H. R. Doodday & Co.'s lumber mills were destroyed by fire last week. The loss amounts to $60,000.00, and is covered by insurance.

Amos Harricana River, Que.—Tenders for the $3,000,000.00 Provincial Legislative Building were opened July 8th, but only two firms had tendered, the Lyall Mitchell Co., Montreal and Winnipeg, and Thomas Kelly & Sons, Winnipeg. The tenders have been submitted to two architects for their report.

Railways--Bridges

Maisonneuve, Que.—The judgment rendered recently by the Railway Commission provides that the C. P. R. build a bridge across Charlemagne Street.

Montreal, Que.—The C. P. R. will string 4,775 miles of new wire on western lines during the next 5 months. The contracts for all the work have not yet been let.

Brampton, Ont.—The Roads and Bridges Committee last week recommended to the council the erection of a bridge with concrete abuttments for the creek on Flodden Street.

Ashcroft, B.C. — Twohy Brothers, railway contractors, expect to have their contract for the construction of a section of the Canadian Northern east and west of Ashcroft completed some time in August of this year.

This section runs from Spence's Bridge east to Wallachin, a distance of approximately 45 miles. The work on the line was begun last fall.

Twohy Brothers have a contract for the construction of a hundred miles of line in the division north of Kamloops, from Mile 80 to Mile 180, and of this they have already completed 65 miles.

North Bay, Ont.—Work has been started on the erection of the additions to the shops of the C. P. R. at North Bay, Ont., and among the buildings to be put up will be an erecting shop, with accommodation for the repair of ten locomotives, a car construction and repair shop and an additional machine shop.

Quebec, Que.—Fraser & Atkinson, engineers of the Transcontinental Railway Commission, have submitted to Mayor Drouin a copy of the contract between the commission and the city relative to the construction of the workshops at St. Malo. Mayor Drouin will study the contract with the city legal advisors, and it is expected the document will be signed in the course of a few days.

Vancouver, B.C.—Two contracts for steel bridges have been awarded recently to the Canadian North-West Steel Company. The first is for ten bridges on the Canadian Northern right-of-way. These will be of heavy plate-deck girder span type. The other contract is for a steel viaduct from the foot of Burrard Street to pier B, which is being erected for the C. P. R. as a direct means of communication with Hastings Street.

Toronto, Ont.—Plans for the new Union Station to be built in Toronto show that the building will be of white stone with steel frame and fireproof throughout. A network of subways will form the approaches to the trainsheds which will be connected with the passenger platforms by a number of freight and passenger elevators. Mechanical porters will eliminate the carrying of baggage and an elaborate system of baggage transfers will be installed.

Ottawa, Ont.—It is expected that within the next three months Grand Trunk Pacific passenger trains will be running between Montreal and Tete Jaune Cache in the mountains. The route from Montreal westward will be via Toronto, over Grand Trunk lines to North Bay, thence by the T. & N. O., over which the Grand Trunk has running rights, to Cochrane, thence over the transcontinental to Winnipeg, and for the remainder of the way over the Grand Trunk Pacific to Edmonton and into British Columbia. An alternative route will be provided from Montreal to Ottawa and thence over the old Canada Atlantic to Scotia Junction and Parry Sound.

Water Works

Port Coquitlam, B.C. — Operations were commenced on the installation of the Port Coquitlam $30,000 waterworks system here recently at a ceremony presided over by Mayor Mars. The water will be brought from the New Westminster main from Lake Coquitlam, and be distributed through local mains, the first of which was started on Railway Avenue 150 feet from the Pipe Line Road.

Tenders

Guelph, Ont.—The Sewerage and Public Works Commission will purchase a cement mixer.

London, Ont.—The steam plant of the London and Lake Erie Transportation & Railway Co. is for sale.

Toronto, Ont.—The city is in the market for a Pulmotor and steel boat for drowing accident rescue service.

Coaticook, Que.—The town is in the market for a steam roller, and tenders have been submitted by three firms.

Ottawa, Ont.—It is understood that only one tender has been received for the P. I. E. terminal of the I. C. R., which is from Albert Mackie of Toronto, associated with M. J. O'Brien.

Contracts Awarded

Ottawa, Ont.—The Government has awarded the contract for building a government drydock at St. Joseph de Levis, Que., to the firm of M. P. and J. T. Davis, Ottawa, for $2,721,116.

Edmonton, Ont.—The Cannal & Spencer Construction Co. has been awarded the contract by the city for the erection of a laundry and powerhouse for a hospital at a cost of $45,000.

Toronto, Ont.—The Temiskaming and Northern Ontario Railway are reported to have placed an order with the Pullman Co., New York, for two complete all-steel pasenger trains, to be delivered next year.

Fort William, Ont.—The Canadian Pacific Railway have awarded a contract to John S. Metcalf Co., Limited, Montreal and Chicago, constructing engineers, for extensive work in connection with the steel river house at Elevator "D," Fort William, Ont. Estimated cost is $45,000.

Ottawa, Ont.—Contracts awarded by the Government recently were as follows: The C. S. Boon Dredging & Construction Co., Toronto, gets contract for dredging at Collingwood to the extent of $549,560. The Soo Dredging & Construction Co. get dredging contract at Bruce Mines, Ontario, to the extent og $8,832. The Maritime Dredging Co. gets dredging contract at Digby, N. S., for $43,600. The T. A. Fowlie get dredging contract at Little Black River, N. B., for $11,095. The Maritime Dredging Co. get contract for dredging at St. Stephen, N. B., for $7,935. Contracts were also awarded to D. Jamieson & Son, for an electrical passenger elevator in public building at Sault Ste. Marie for $11,100; to G. C. Hurrell, Victoria, B. C., for construction of Observatory Building, at Gonzales Heights, Victoria, B. C., for $11,900.

Refrigeration

Medicine Hat, Alta.—A Creamery and Cold Storage Co. recently made an agreement with the city to build a plant costing $50,000.00.

The York Mfg. Co., York, Pa., report the following recent sales:—The Dominion Brewing Co., Toronto, Ont., one 40-ton horizontal double-acting belt steam-driven refrigerating machine and high pressure side complete; The MacKenzie Electric Co., Sarnia, Ont., one 1-ton vertical single-acting belt-driven enclosed type refrigerating machine and high pressure side complete; The T. Eaton Co., Ltd., Toronto, Ont., one 8-ton vertical single-acting belt-driven enclosed type refrigerating machine and high pressure side complete; also a 11-ton vertical single-acting belt-driven enclosed type refrigerating machine and high pressure side complete.

Miscellaneous

Hamilton, Ont.—The Dominion Railway Board will meet here in two weeks' time to attempt to reach a settlement between the C. N. R., G. T. R. and the T. H. and B. respecting an entrance into the city. The later are opposed to the entrance.

The St. Lawrence and Great Lakes Commission.—A water power commission is to be appointed by the Government to study the field of waterpower developement from the head of the lakes to Montreal. It is expected the commissioners will be Professor McLeod of McGill University, Arthur Surveyor of Montreal, and C. R. Coutlee of the engineering staff of the Department of Public Works.

Personal

R. W. Burnett, master car builder at the C. P. R. Angus shops, has been elected president of the Canadian Railway Club, Montreal, for the ensuing year.

T. Blundell Brown and E. Maes Harvey, of London, England, two members of the board of directors of the B. C. Electric Co., arrived in Vancouver last week.

Charles Murphy, general superintendent of Eastern lines of the Canadian Pacific Railway, has accepted the position of general superintendent of the Manitoba division, with headquarters in Winnipeg. He succeeds D. C. Coleman, who has been appointed to the Alberta division.

C. R. Burt, Rockford, Ill., has been appointed factory manager of the Russell Motor Car Co., Toronto, in succession to K. B. MacDonald, who recently resigned. Mr. Burt brings to the company a complete experience in machine shop practice He was for nine years with Brown & Sharpe, the celebrated machine tool manufacturers, Providence, R.I., first as foreman of their tool room, and latterly in charge of their gear and assembling departments. He visited Europe on their behalf to investigate comparative methods of manufacture in Europe and America. For the past eight years he has been general superintendent of the Barber-Coleman Co. plant at Rockford, Ill., manufacturing textile machinery, automobile machinery and parts. He thus brings to his new position a special knowledge of machine shop methods as practised in the best equipped shops of the United States. Mr. Burt will take up his new duties in August .

Trade Gossip

The Terry Steam Turbine Co., Hartford, Conn., have sold to the O'Keefe Brewery Co., of Toronto, Limited, a 25 H.P. Terry turbine-driven pump.

Marine

Montreal, Que.—The Harbor Commissioners have passed plans for the extension of the piers in the harbor.

Port Coquitlam, B. C.—A contract will be let shortly to deepen the waterway up the Fraser River to Port

Ideas at Two Cents Each

¶ An idea that's worth anything at all to a Mechanical man is worth more than two cents.

¶ It might be worth hundreds of dollars.

¶ Every issue of "CANADIAN MACHINERY" is full of practical, helpful ideas. You ought to be able to sift out four each month that would prove of some use to you. Put a value of two cents on each and your subscription has been paid.

¶ You cannot afford to miss even one issue—you might miss the idea that would be worth hundreds of dollars.

¶ The date on the label of your "CANADIAN MACHINERY" wrapper shows when your subscription expires. One dollar will renew it for a year.

Don't put off Renewing—Do it to-day

Ten Salesmen and Ten Salesmen PLUS—

¶ Let us take two competing firms whose lines are to all intents and purposes exactly the same.

¶ Let their policies and their service be of the same high order.

¶ And let each have *ten* salesmen of average calibre and ability.

¶ All things being equal the result of the competition is a draw. It is a tug of war with an even strain on the rope.

¶ Now let one firm become dissatisfied with this even condition of affairs. Let the idea of advertising possess it.

¶ Let the idea crystalize and publicity be added to the selling force of the progressive house.

¶ Each firm still has ten men on the road. Their individual efforts remain the same, apparently, but ten of them are now reinforced by the mightiest selling force in the modern world.

¶ One firm—the advertiser—slides ahead. The other—the stand-patter—slips behind.

¶ It is inevitable.

¶ Ten men are working under a handicap. Ten men at an advantage.

¶ The tug of war is over. It is now a case of follow the leader.

¶ If you have not already put this tremendous force of advertising behind your men you ought to, and without delay.

Rate Card and full information gladly furnished.

New Incorporations

The White Rock Water Works Co., Ltd., has been incorporated in British Columbia to take over H. T. Thrift's water license at White Rock, B. C.

Calgary, Alta.—For the purpose and object of supplying the citizens of Calgary and the surrounding towns with pure, distilled water, a new joint stock company has been formed and incorporated under the name, Calgary Polar Water Company, Limited. The capital is $15,000, divided into $1,500 shares of $10 each. The directors are: Dr. F. H. Mayhood, M. H. O., Dr. C. F. McGuffin, W. A. Lewis, C. L. Turnbull, all of this city. The bankers are the Imperial Bank of Canada; solicitors, Clarke, McCarthy, Carson and Macleod and secretary and registered office, W. A. Lewis, room 404, Beveridge Block, Calgary.

Catalogues

The Slack Mfg. Co., Springfield, Vt., have sent us a leaflet describing the abrasive metal cutter manufactured by them. This machine is fitted with a special cutting emery wheel and will cut high-speed or carbon steel, bronze, etc., in any form. A copy of this leaflet may be had on request.

The Monarch Electric Co., Ltd., St. Lambert, P.Q., have sent us a copy of their latest list of electrical supplies. The catalogue describes and illustrates clearly the various types of electrical fittings and switches, etc., which they manufacture. It is a creditable production, and copies will be gladly sent to interested readers.

The Canadian Detroit Lubricator Co., Ltd., Walkerville, Ont., have published a new catalog No. 36L describing their "Bulls eye" locomotive lubricators and specialties. The lubricator is of the hydrostatic sight feed type, and is made in several sizes. A detailed description is given and each size clearly illustrated. Copies may be had by writing.

The Wiener Machinery Co., New York, have sent us a copy of a pamphlet which they have published recently. The pamphlet describes and illustrates clearly the "Oeking" triple punch and shear, the "Oeking" quadruple combination shear and the "S & N" gate, beam and angle shears, etc. Tables and illustrations are given showing the capacity and scope of these machines. A copy of this pamphlet will be gladly sent to interested readers.

Book Reviews

Catechism on Alternating Current Apparatus.—As a companion book to "Catechism on Direct Current Apparatus," Fairbanks, Morse & Co., of Chicago, have recently issued a Catechism on Alternating Current Apparatus. It is a booklet dealing with the construction and application of generators, motors and auxiliary equipment, in which the writer has succeeded in giving in condensed "question and answer" form a very great amount of practical information. From a short description of how alternating current is produced, arguments are given not only on general points of construction and operating characteristics of A.C. equipment but also on such points as: Advantages of alternating current; advantages of direct current; choice of A.C. or D.C.; electrical characteristics that must be considered in comparing alternators; advantages and limitations of synchronous motors; split phase motors, etc., etc. A glossary covering all electrical terms used is included which also makes the book of considerable value to the non-technical man. The booklet is well illustrated with cuts of Fairbanks-Morse alternating current apparatus, and is well printed on enamelled stock. We can very favorably recommend it to all engineers, and as in the case of the Direct Current Catechism, it will prove of great assistance to one unfamiliar with electric machinery and its operation. Copies will be sent to interested parties on request to the Chicago office of the company.

Pumping and Water Power, by Fred. A. Bradley. Cloth 116 pages, 51 illustrations. Published by E. & F. N. Spon, Ltd., London, England. Price $1.25. This book is, as its sub-title states, a guide to the hydraulic laws and conditions influencing pumping operations and to the efficient use of pumping and water power apparatus. The first chapters are devoted to the theory of hydraulics, pumping work and friction of water, etc.; other chapters deal successively with steam and centrifugal pumps, hydraulic machinery and rams, water wheels, water turbines, etc. As the work has been compiled principally for the benefit of students and mechanics, no highly theoretical matter has been included, the subject being treated in a practical and concise manner. It is perhaps to be regretted that the author has devoted so little space to centrifugal pumps, seeing the strides that this type of pump has made in recent years. A number of useful tables on hydraulics, etc., are included.

MILLEN-IUM

HIGH SPEED

Hack Saw Blades

are certainly making good with exacting users throughout the country, as we were sure they would.

Our confidence in these British blades is based on thorough tests in our own warehouse, extending over several months, cutting Selby Tubes in lengths to suit our customers. They cut cleaner and faster, and stand up to this difficult work better, than any other blades we have ever used.

Our confidence in their high quality is expressed by putting them out under our own name and the "MILLEN-IUM" Trade Mark.

Millen-ium High Speed Hack Saw Blades are not cheap in first cost—but you'll get the most service out of them per dollar paid.

Write us for a Sample Millen-ium Blade for either hand or machine work, stating the kind of material you wish to cut, and we'll send it promptly without charge.

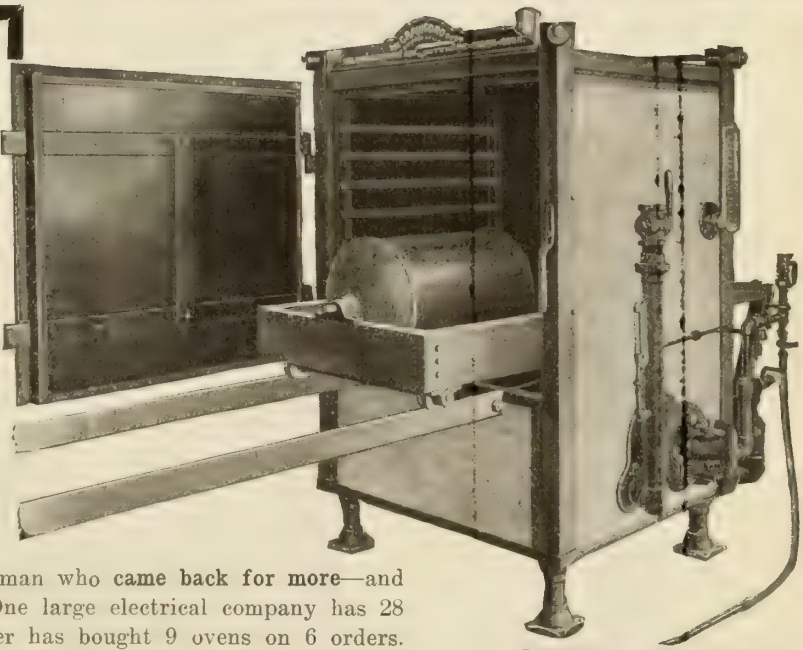
That is why we are proud of the record of

Crawford Sectional Ovens



Every other one we sell is delivered to a man who **came back for more**—and many of them have come back several times. One large electrical company has 28 ovens, purchased on 12 separate orders. Another has bought 9 ovens on 6 orders. A noted automobile manufacturer has 11 ovens, on 5 different orders.

We build special ovens to meet **your** requirements, for Core Baking, Bluing, Japanning, Lacquering, Enamelling, Drying, etc.

Send for Catalogue C, describing the oven with the Inclosed Flame Gas Burner.

The Oven Equipment and Manufacturing Company
New Haven, Connecticut

54-1

They Don't "Chip at the Lip"

Do the drills you're now using chip at the lip; do they dull quickly; do they prove "soft" when re-ground?

Whatever your drilling problems may be, we **know** that the use of "Detroit" Twist Drills will solve them—solve them to your satisfaction and profit.

"Detroit" Twist Drills

won't chip at the lip; they'll do more work with less re-grinding than other drills and they won't prove soft when they are re-ground.

"Detroit" Drills run perfectly true from tip to shank; the lips are equal—which means that **both** lips cut all the time; the web is central and they are ground to the 1-2000 of an inch.

There's a "Detroit" of the exact size and kind to meet every drilling need and our absolute guarantee of satisfactory service means that we will solve your drilling problems or refund the purchase price.

Trade *Mark*

Let us show you what we mean by "Satisfaction." Catalog "R" on request.

Little Giant

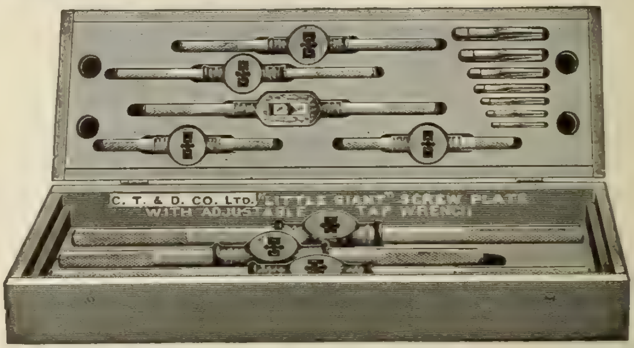
Taps, Dies, Screw-Cutting Tools, etc.

Of the Highest Prevalent Quality and Efficiency

We guarantee our tools to give you an economical service. They work better and last longer.

Write for our finely illustrated Catalogue. 8

THE CANADIAN TAP & DIE CO., LIMITED
GALT, ONTARIO



C. T. & D. CO. LTD. "LITTLE GIANT" SCREW PLATE WITH ADJUSTABLE TAP WRENCH

Economy in producing pieces where the expense does not warrant setting up automatic screw machines

In many shops many lots of a hundred or so of screws, studs, pins, washers, or other pieces are wanted from time to time, and the problem is one of producing them most economically. Such jobs do not warrant the time and expense of setting up an automatic screw machine. Neither do they if there are considerably larger quantities, unless lots come along at regular intervals.

For this reason it is advantageous to supplement the automatic screw machines in a shop with

WIRE FEED SCREW MACHINES

which are especially adapted for producing this class of work economically.

These machines can be quickly and easily set up and are so arranged that the workmen can operate them rapidly. The chuck and feed for stock are automatic and rapid in operation. All levers and pilot wheels are conveniently located so that the operator does not have to change his position.

Irregular Pieces Made From Forgings and Castings can also be produced to good advantage on these machines by using an ordinary chuck.

What Size Machine Are You Interested In?

BROWN & SHARPE MFG. COMPANY, - PROVIDENCE, R.I.

Agents: The Canadian-Fairbanks-Morse Co., Ltd., Toronto, Montreal, Winnipeg, Calgary, Vancouver, St. John, Saskatoon.

CANADIAN MACHINERY BUYERS' DIRECTORY

To Our Readers—Use this directory when seeking to buy any machinery or power equipment.
You will often get information that will save you money.
To Our Advertisers—Send in your name for insertion under the heading of the lines you make or sell.
To Non-Advertisers—A rate of $5 per line a year is charged non-advertisers.

STEEL WIRE CHAINS

Lightest, strongest and best.

Made in thirteen sizes, from 360 to 2250 lbs. breaking strain.

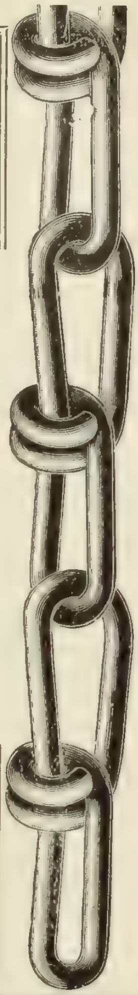
In any length or cut to size.

Special chains made to order.

Write for catalogue and samples.

THE B. GREENING WIRE CO., Limited

HAMILTON, ONT. MONTREAL, QUE.



FILE
EFFICIENCY IS
MAN
EFFICIENCY

NICHOLSON-MADE files are sharp-toothed and fast-cutting tools. Each file at 15, 20, or 25-cent cost maintains the efficiency of costly skilled labor, and speeds production by that labor.

In each factory there is a point at which it pays to substitute a perfectly new file for one used some time, sometimes a period of only a few hours.

When you ascertain this period for your factory, the best of all files are Nicholson-made Brands. Issue them—they are uniform, hand-tested, made in special steel, by private machines, and hardened by a special process. At all jobbers.

"Nicholson-made" File Brands:
American, Arcade, Great Western,
Globe, Kearney & Foot.

Hack Saw Economy

does not mean using a saw that is dull just to save using a new one. It means using a saw that is sharp enough to cut rapidly and discarding it when it begins to cut slowly. But the fewer changes you have to make the better, for each change means just so much time lost. Therefore, the real economy is in buying a hack saw that lasts longer and cuts while it lasts. The saw that does just this is the

STARRETT HACK SAW

The set of the teeth, the shape of the points, and the quality and temper of the metal they are made of, determine the speed and lasting qualities of these Starrett hack saws. If your hack saws aren't giving you satisfaction consult our catalogue No. 193 and learn which saws you need. Then get a supply at your hardware dealers'. It will pay you.

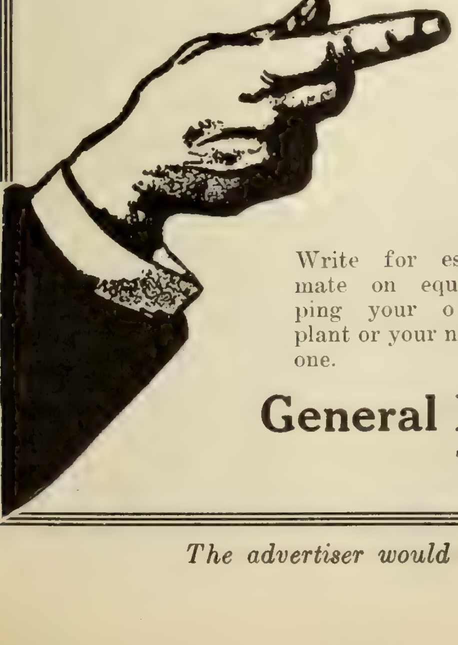
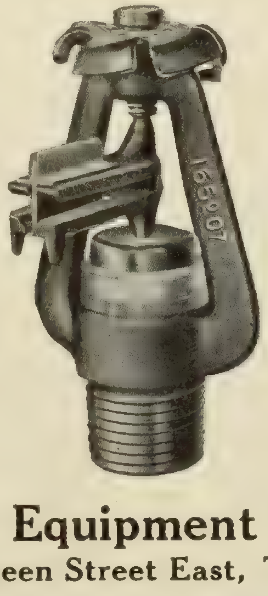
Fire Gets No Headway

In The Plant That Is Equipped With

MANUFACTURERS' AUTOMATIC SPRINKLERS

Recognized by leading engineers as one of the best, if not **the** best Sprinkler System in the world.





They have extinguished scores of fires in many of the largest plants in Canada and the United States, before the fire could make headway.

As a matter of economy you should instal them, because they will save 80 per cent. of your insurance premiums. The saving thus effected will pay for the installation in from three to five years.

Write for estimate on equipping your old plant or your new one.

STEEL CASTINGS

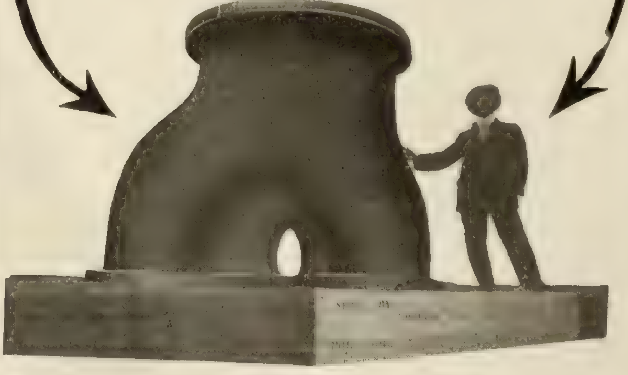
All Sizes, ¼ lb. to 30,000 lbs.

We make New Process Converter Steel Castings, annealed and unannealed; also Chrome-Manganese and Nickel Steel Castings.

Our castings are perfect, yet they can be procured at a price that will insure economy.

Every one guaranteed.

Ask us for estimates.



Casting for a 10,500 H.P. Water Wheel.

JOLIETTE STEEL CASTINGS WORKS, LTD.
Head Office and Foundry: JOLIETTE, P.Q.

CASTINGS
IN
BRASS and BRONZE

We specialize on
Bearing Bronze,
Gear Bronze,
Manganese Bronze.

LUMEN BEARING COMPANY

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

Air Compressors.
Cleveland Pneumatic Tool Co. of Can., Toronto.
Canadian Ingersoll-Rand Co., Ltd., Montreal.
Detroit Foundry Supply Co., Windsor, Ont.
E. J. Woodison Co., Toronto.

Alloys.
Hermann Boker & Co., Montreal.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry Sup. Co., Montreal.
Frederic B. Stevens, Detroit.
E. J. Woodison Co., Toronto.

Ammeters.
Bennett-O'Connell Co., Chicago.
Detroit Foundry Supply Co., Windsor, Ont.
E. J. Woodison Co., Toronto.
W. W. Wells, Toronto.

Autogenous Welding
W. D. Beath & Son, Toronto.
Detroit Foundry Supply Co., Windsor, Ont.

Barrels, Tumbling.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor.
Dominion Fdry Sup. Co., Montreal.
Federal Fdry. Supply Co., Cleveland.
Frederic B. Stevens, Detroit.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
E. J. Woodison Co., Toronto.
Whiting Foundry Equipment Co., Harvey, Ill.
W. W. Wells, Toronto.

Blowers.
Can. Buffalo Forge Co., Montreal.
Can. Hanson & Van Winkle Co., Toronto.
Canadian Ingersoll-Rand Co., Ltd., Montreal.
Detroit Foundry Supply Co., Windsor,
Dominion Fdry Sup. Co., Montreal.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Monarch Eng. & Mfg. Co., Baltimore,
J. W. Paxson Co., Philadelphia, Pa.
W. S. Rockwell Co., New York.
E. J. Woodison Co., Toronto.

Blast Gauges—Cupola.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry Sup. Co., Montreal.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Sheldon's, Limited, Galt.
Frederic B. Stevens, Detroit.
E. J. Woodison Co., Toronto.

Brass Melting Furnaces.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry Sup. Co., Montreal.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Monarch Eng. & Mfg. Co., Baltimore,
J. W. Paxson Co., Philadelphia, Pa.
W. S. Rockwell Co., New York.
Frederic B. Stevens, Detroit.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Brushes, Foundry and Core.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor.
Dominion Fdry Sup. Co., Montreal.
B. Greening Wire Co., Hamilton, Ont.
Federal Fdry. Supply Co., Cleveland.
Osborn Mfg. Co., Cleveland, O.
J. W. Paxson Co., Philadelphia, Pa.
Frederic B. Stevens, Detroit, Mich.
E. J. Woodison Co., Toronto.

Burners, Core Oven.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Monarch Eng. & Mfg. Co., Baltimore,
Osborn Mfg. Co., Cleveland, O.
W. S. Rockwell Co., New York.
Frederic B. Stevens, Detroit, Mich.
E. J. Woodison Co., Toronto.

Cars, Core Oven.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Monarch Eng. & Mfg. Co., Baltimore,
Osborn Mfg. Co., Cleveland, O.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Cars, Foundry.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Toronto.
Monarch Eng. & Mfg. Co., Baltimore,
Frederic B. Stevens, Detroit, Mich.
Whiting Foundry Equipment Co., Harvey, Ill.

Charcoal.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor.
Dominion Fdry. Sup. Co., Toronto.
Frederic B. Stevens, Detroit, Mich.
E. J. Woodison Co., Toronto.

Chaplets.
Hill & Griffiths Co., Cincinnati, O.

Clay Lined Crucibles.
McCulloch-Dalzell Crucible Company, Pittsburg, Pa.

Core Binders.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
J. W. Paxson Co., Philadelphia, Pa.
Robeson Process Co., Au Sable Forks, N.Y.
E. J. Woodison Co., Toronto.

Core Box Machines.
Dominion Fdry. Sup. Co., Toronto.
J. W. Paxson Co., Philadelphia, Pa.
E. J. Woodison Co., Toronto.

Core Cutting-off and Coning Machine.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Montreal.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
E. J. Woodison Co., Toronto.

Core Compounds.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor.
Dominion Fdry Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
J. W. Paxson Co., Philadelphia, Pa.
Robeson Process Co. Pennington, N.J.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Core Machines, Hammer.
Brown Specialty Machinery Co., Chicago, Ill.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.

Core-Making Machines.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Montreal.
Federal Fdry. Supply Co., Cleveland.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Core-making Ovens.
Oven Equipment & Mfg. Co., New Haven, Conn.

Core Oils.
Cataract Refining Co., Buffalo, N.Y.
Detroit Foundry Supply Co., Windsor, Ont.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Holland Core Oil Co., Chicago.
Federal Fdry. Supply Co., Cleveland.
E. J. Woodison Co., Toronto.

Core Ovens.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor

Exit The Old-Fashioned Barrel

The old style horizontal tumbling barrel has been convicted of time killing. It has to go. And in its place comes the fast, efficient and economical

GLOBE TUMBLING BARREL

This barrel overcomes all the deficiencies of the horizontal barrel. It will do either gentle or violent tumbling. It does not have to be stopped for filling, emptying or inspecting of the work. And it gives a finer finished grade of tumbling than any other barrel.

Our new catalog 2 tells about the eight stock sizes, which range in price from $50 to $170. Write for it to-day.

The Globe Machine & Stamping Co.

CLEVELAND, Ohio., U.S.A.

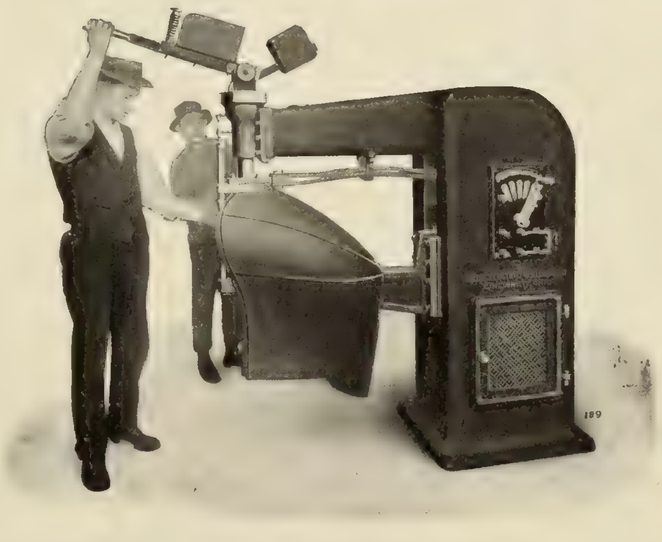
RIVETING COSTS REDUCED

An Automobile Body Manufacturer cut his costs 250 per cent. by the use of a "TOLEDO" Spot Welder. He makes a better product and undersells others who stick to the old way of riveting. He was "from Missouri," but we "showed him" by our 30 days' free trial just what he could do. Do you want to try one on the same terms? It's yours. Name and address, please.



The electric way of riveting. No holes to punch. No rivets used.

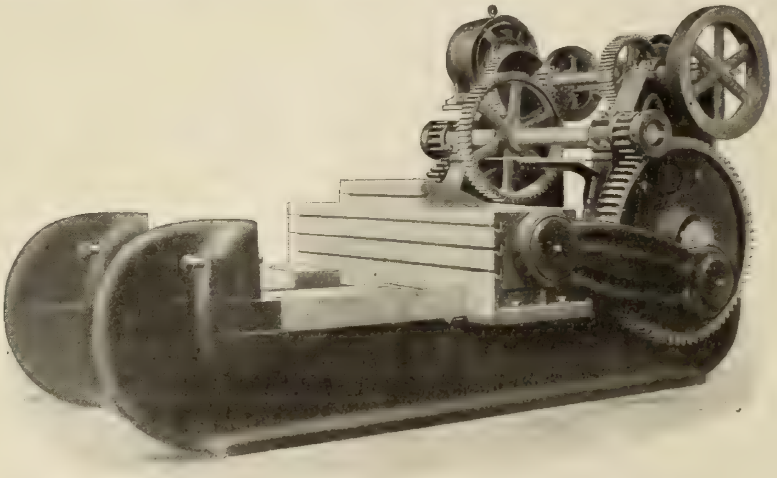
NO LEASE. NO LICENSE. NO ROYALTY.

THE TOLEDO ELECTRIC WELDER COMPANY
CUMMINSVILLE, CINCINNATI, OHIO

The Bulldozer Line

MANUFACTURED BY

WILLIAMS WHITE & CO. MOLINE, ILL.



No. 9 BULLDOZER, MOTOR DRIVEN

The BULLDOZER is a wide, roomy, long-stroke, powerful press, having ample die space for large forms. It is primarily intended for hot bending and shaping, but is also well suited for hot punching. To a less degree it is used for cold punching, bending and straightening, and much light work is produced cold on the machine.

Send us a blue print showing the work required and we shall be pleased to specify the machine best suited for the job.

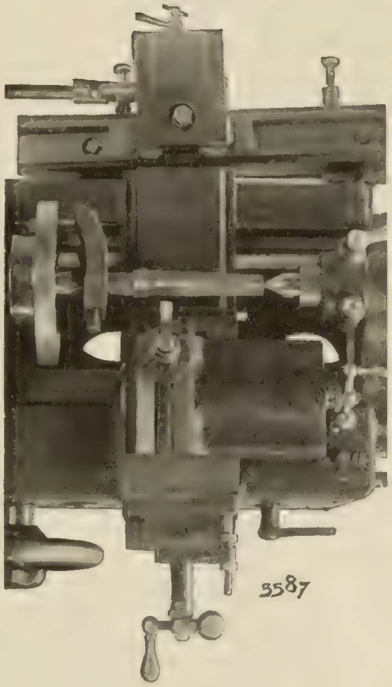
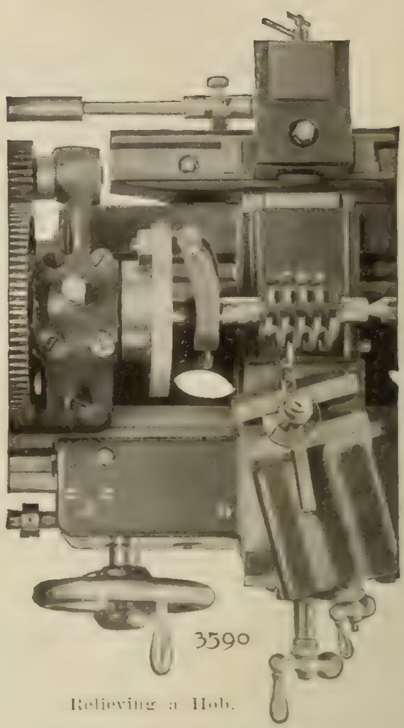
The Most Efficient Method Of Handling Your Relieving Operations



Pratt & Whitney Engine Lathes

With Relieving Attachment

A simple, accurate, efficient device which has proved almost universal in its application. Conveniently located, yet out of the operator's way. Does not interfere with the use of the taper-bar or the compound rest.



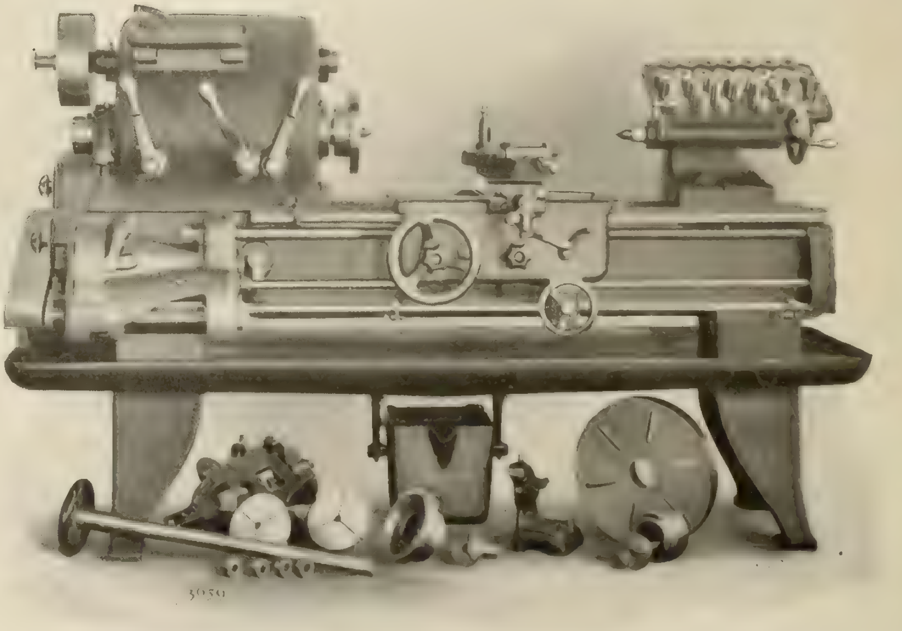
Relieving a Hob.

Regular Relieving Attachment

For radial relieving of any description, such as Hobs, Cutters, Taps, etc.

Spiral Relieving Attachment

For spiral relieving, works in conjunction with the regular attachment.



P. & W. 16-inch Engine Lathe Single Pulley Drive All Geared Head and Pan Bed

Side Relieving Attachment

For side or relieving parallel to the axis such as on counter bores, sides of cutters, etc. This attachment, while separate, requires the same driving parts and change gears as the regular attachment.

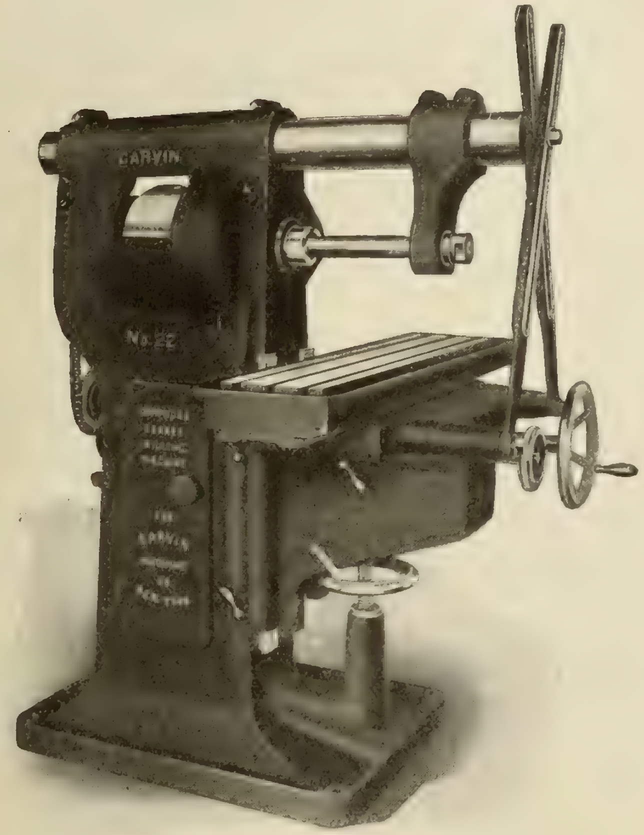
MOST POWERFUL MILLING MACHINE

(Knee Type)



GARVIN No. 22, Plain Milling Machine Compound-Geared. Use Code, "Aperient"

The machine shown is the most powerful Knee Type Milling Machine manufactured by us, having Compound Back Gearing whose ratio is 10 to 1, through steel gears. It will transmit 10 horsepower to 14 inch cutters, running 20 revolutions on steel castings. The machine has a wide faced pulley of 11 inches in diameter, running loose on the spindle. The power is taken from the countershaft by a 6-inch double belt to this pulley and double-backed-geared back to the spindle. The machine has an arbor 2 inches in diameter, solid, with spindle, thus avoiding a lot of arbor troubles.

DIMENSIONS

Length of automatic feed of table	28 in.
Dimensions inside of oil pockets	43½x9 in.
Vertical adjustment	15½ in.
In and out adjustment	7 in.
Crated weight	3250 lbs.

No. 3 Rockford Hand Miller

For Horizontal Or Vertical Milling

The combination screw and lever feed permits maximum efficiency for light, rapid cuts, and for heavy work where a large stock must be removed the two feeds do not interfere, and a change from one to the other can be instantly made.

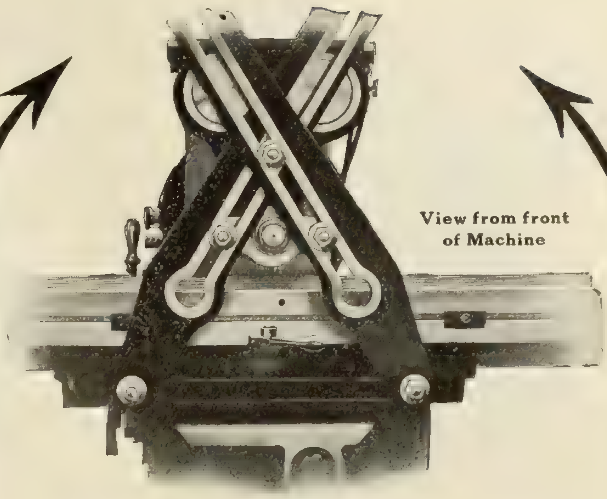
Vibration is reduced and cutting capacity increased by the Patent flanged support which is bolted near seat of column.

This miller is fitted with latest and improved attachments for special work.

ASK FOR FULL PARTICULARS.

Rockford Milling Machine Co.

ROCKFORD, ILLIONIS, U.S.A.



Two Over-Arms

Instead of One

A distinctive "Milwaukee" feature which is revolutionizing milling machine work.

Here's What It Is. Two steel bars arranged accurately parallel with the spindle and at sufficient distance apart to form a rigid truss when arbor bearings are clamped to them.

Here's What It Effects. Aligns the cutter arbor positively and keeps it true. Makes pounding of the bearing out of line by the cutters impossible. Permits use of large, coarse pitch cutters on rough, heavy work at much greater distance from the face of the column.

We Want To Tell You

all about this new construction and about the cascade lubricating system, constant speed drive, box section knee, and the other big improvements in MILWAUKEE MILLERS which have led up to this biggest improvement of all.

Write for the Double Over-Arm Circular.

For A Foundation

"Detroit" Twist Drills have the best "small tool steel" to be obtained. This fundamental requisite is supplemented by 27 years' experience, the best workmanship and the most exacting supervision of every process.

Each successive operation is submitted to the most rigid inspection and each tool in the making must pass thorough the inspector's hands from three to eight times.

"Detroit" Twist Drills

runs absolutely true from tip to shank, drill fast and drill a maximum number of holes without regrinding. The lips are equal, the web central and the grooves milled with the utmost care.

They are ground on their centers—after hardening—and the limit for variation permitted in any but the larger sizes is the 1-12000 of an inch.

They speed the work of men and machines. They reduce shop cost and every one is guaranteed. Write to-day for Catalog "R."

Geometric Screw-Cutting Die Heads Lead

They are in general use on Screw Machines and Turret Lathes.

Employed in cutting right and left-hand threads of standard or special pitch; also various special forms, such as the Acme, Metric, etc., as well as standard pipe threads.

The chasers are opened automatically, and there is no running back over the work after the thread is cut.

Geometric Die Heads

Can be furnished for cutting any size thread from the smallest screw up to the greatest diameter required.

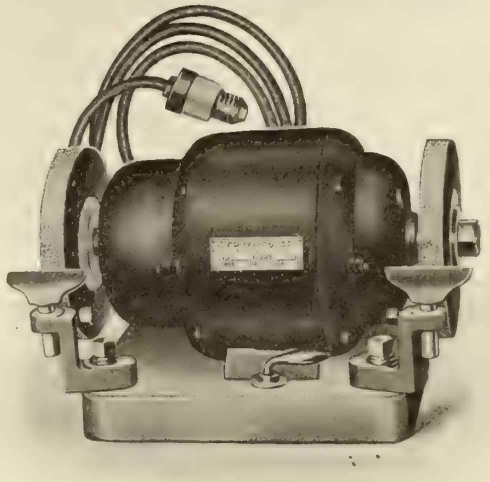
Tell us your requirements, and we will recommend the Die Head.

THE GEOMETRIC TOOL COMPANY
NEW HAVEN, CONN.

Canadian Agents: Williams & Wilson, Montreal.
The A. R. Williams Machinery Co., Toronto.

ELECTRIC BENCH GRINDER

You will find it the handiest tool in your Shop!



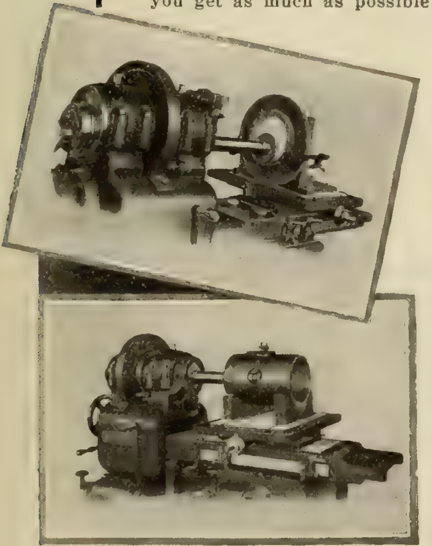
We are now prepared to supply them as follows:

No. 1, 1/6 H.P., A.C., capacity two 6 x ¾ in. Emery Wheels.
No. 2, ¼ H.P., A.C., capacity two 6 x 1 in. Emery Wheels.
No. 2, ¼ H.P., D.C., capacity two 6 x 1 in. Emery Wheels.
No. 3, ½ H.P., D.C., capacity two 8 x 1 in. Emery Wheels.
No. 4, 1 H.P., D.C., capacity two 10 x 1 in. Emery Wheels.

STOW MFG. CO.
BINGHAMTON, N.Y., U.S.A.

DO YOU WANT
Rigidity and Rapidity?

No belts to shift, variable speeds and feeds, instantaneous control, the best of material, the best of workmanship, ample vertical and horizontal adjustments, and service that will help you get as much as possible out of the machine.



Then Buy a Heald Cylinder Grinder

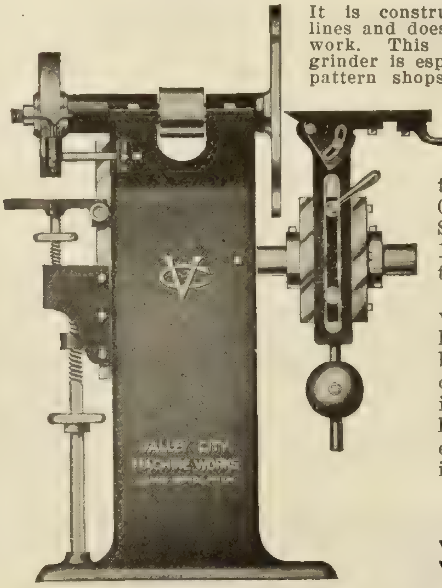
While designed especially to grind the bore of internal combustion engines, it is used largely for grinding holes in parts, which, due to their weight or shape, cannot be rotated conveniently, for instance, pillow blocks, large gears, plain cylinders, large cams, valves, connecting rods, air compressors, pumps, etc.

There is a copy of our book "CYLINDER GRINDING" waiting for you. Better send for it.

The Heald Machine Company
8 New Bond Street, Worcester, Mass.

No. 9 Disc and Surface Grinder

Here is the Machine That will Meet *Your* Requirements.



It is constructed on practical lines and does the finest kind of work. This disc and surface grinder is especially adapted for pattern shops, die makers, and all kinds of tool and surface grinding.

Disc side has table tilting from 0 to 43 degrees. Size of disc table, 10x10 in. Diameter of disc, 18 in. It will solve your vibration problem. It is strongly built of one solid casting; and satisfactory tests have demonstrated that vibration is avoided.

Our Catalogue will Interest You. Write for it now.

The Head Of The Firm

¶ The principal business of a head of a firm is to keep that firm from making a decision to-day that will involve it in trouble to-morrow. The principal business of a head of a department is to keep that department from spending money on campaigns or policies that do not produce results.

¶ A business organization may be ever so magnificently constructed; may be organized with almost infinite perfection, yet a few erroneous policies will run this organization into an "iceberg," and the work of years, the experience of many men all go down in the mad whirl of business blunders.

¶ You know the Titanic was a magnificently constructed ship, "unsinkable," and the probabilities are that not a finer, more substantially built boat ever started across the sea—but she was not intelligently manipulated.

¶ Most any average man who has had the necessary training can write a fairly good letter or a fairly good advertisement, but to know the "bum schemes" that will not produce business, comes from nights and days of honest study, from vision that is as clear as light and from a deep and vast experience.

¶ The employees of a Company require inspiration. They must have confidence in the firm, and last and always they must believe in the magic word or the magic judgment of the man at the head of the firm. And the biggest thing the man at the head of the business has to do is to keep the members of that organization from doing the wrong thing.

¶ To inspire employees, to inspire confidence and inspiration are not enough, because it is very easy for a business or for a business man in an inspired moment to make a statement, to become involved in a controversy which only years of work, manipulation and a lot of money can ever set right.

¶ At this moment I have in mind a large business recently sold, the purchase of which is almost entirely covered by personal notes, and a personal note for a hundred thousand dollars is of no greater value than the capacity of the man behind it and here are a quarter of a million dollars, hanging on the uncertain thread of a promise made by a man who is not capable of manipulating the business ship he has set out to sail.

¶ If this is true, here is a quarter of a million dollar investment "set out to sea" without proper direction. Without a well-balanced analysis of the proper basis upon which such a business deal should be made. Money has been spent and money has been entrusted without judgment.

¶ This is the crime of the Commercial Age of the World in which we are now living. Responsibility is placed in the hands of people who do not have the capacity to analyze,—people wholly and forever unfit to carry responsibility. So the moral is: the principal business of the man at the head of a business or at the head of a department is to avoid investing or spending money that will not develop returns and at the same time lay a better foundation for a business future.

¶ If there is some one in your organization with the power to spend, and if this individual is not capable of placing this money intelligently, then you are committing a crime against your business and a crime against the man himself.

¶ The man at the head of the business should know how to keep the men responsible for the various departments of his business "out of the ditch." In other words to keep employees from doing the wrong thing.

No. 3A Universal Milling Machine

The Constant Speed Drive Enables You to Pull Heavy Cuts

The constant speed drive type of milling machine was originated at the shops of the Brown & Sharpe Mfg. Co., and placed upon the market by them. The fundamental principle of this type of machine is a single pulley or motor running at a constant speed, from which develop features that are distinctly advantageous in modern milling machine practice.

Brown and Sharpe

on a Milling Machine is just as much of a guarantee to you as the name "Sterling" on silver. You can depend upon a B. & S. Machine to accomplish what is claimed for it. A glance at the above illustration will show the lines and proportions of the machine as a whole, the heavy and massive frame, the large and rigid base, the vertical depth of table, saddle and knee, the rigid arm brace and arbor support, and the accessibility of all hand wheels and levers for controlling the various movements.

Any standard constant speed motor can be employed on this machine. The drive is direct from the countershaft to the machine driving pulley, which is of large diameter and runs at a constant speed.

Capacity of this machine is, longitudinal feed, 30 in.; transverse feed, 10 in.; vertical feed, 19 in.; all feeds automatic.

Write to our nearest branch for special circular containing full description and specifications of the B. & S. No. 3 Universal Milling Machine.

Testing the Hardness of Metals and Its Advantages

By Frank Walker

The author of this article is well known to readers of Canadian Machinery through his contributions on Tool Steel, the Layout and Equipment of the Blacksmith's Shop, etc., and as his present effort deals with a kindred subject, what he has to say will, we believe, again be found interesting and educative.

OF the many properties possessed by the various metals and alloys used in machine construction, none are of greater importance than that of hardness. An accurate knowledge of the hardness of a metal or alloy is of the greatest value both to the designer and the builder of machinery, as from it deductions can be made concerning the ultimate behavior of the material under various conditions and circumstances.

Hardness has been defined as the property of resisting penetration, but there are other stresses to which the material may be subjected, the resistance to these stresses being also defined as hardness—namely, the resistance to tearing or tensile hardness; to rubbing, or abrasive hardness; the ability to return to its original shape after being forcibly deflected, or elastic hardness; and the ability to cut other materials, or cutting hardness.

"Hard" and "Soft" Comparative Terms.

It must be understood that the terms hard and soft are purely comparative. An architect may specify "hard wood" in certain portions of a building, but that wood is only hard in comparison with other woods, and is much softer than the steel tools by which it was wrought to shape. Every schoolboy knows that steel is harder than wood, but the question is, How much harder? Comparison can only be made by some method of testing and measuring.

The most primitive test for hardness was that of scratching or trying to scratch the surface of the hardened article with some material known to be harder, but that gave no absolute means of judging the comparative degrees of hardness of the scratcher and the scratched. No doubt many readers have seen a blacksmith test with a file the hardness of an axe that he has tempered, but how much harder or softer was the axe edge than the file? Or how much harder should the axe be than the wood it has to cut in order that it may carry a good lasting edge without snipping? It was the necessity of obtaining information like this which led to the invention of the various hardness testing and measuring devices, and in this paper the writer proposes to describe briefly the more commonly used of these devices, and also to show how the information obtained may be applied with advantage to machine construction and shop practice.

Hardness Testing Methods.

There are in general use four methods of testing hardness—Turner's scratching test, introduced in 1886; Keep's drilling test, introduced in 1887; Brinell's indentation test, introduced in 1900; and Shore's rebounding test, introduced in 1907.

Each of these methods has its limitations, and also it sadvantages, as will be seen by a general description of the principles of each one.

The Turner Scratching Device.

In the Turner scratching device, or Sclerometer as it is named, a weighted diamond-pointed instrument is drawn once backwards and once forwards on the same line over a polished surface of the material to be tested, and the measurement of the hardness is the weight in grammes (a gramme is approximately 1-28 ounce) on the diamond required to produce a scratch which is just visible to the naked eye as a black line on the polished surface, and can just be felt by a sharpened quill drawn over the surface at right angles to the scratch. This form of test is only applicable to such materials as can be polished to a fairly smooth surface, also the standard depth of scratch requires considerable experience to define.

Keep's Drilling Test.

In Keep's drilling test an apparatus causes a steel drill of standard size and hardness to make a definite number of revolutions while it is pressed by a standard force against the piece to be tested. The hardness is automatically recorded by a diagram on which a dead soft material gives a horizontal line, and a material as hard as the drill itself gives a vertical line, so that the hardness of the material being tested is shown by the angle of the line on the diagram, a material of medium hardness giving, of course, an angle of about 45 degs. This test is particularly adapted to all kinds of castings, but, as will be understood, cannot be applied to materials which are harder than the drill.

Brinell Indentation Test.

In the Brinell indentation test a hardened steel ball, 10 millimetres (0.3937 inch) in diameter, is pressed by a pressure of 3,000 kilogrammes (6,614 pounds) into the smooth face of the material when testing iron or steel, but when testing softer materials, a pressure of 500 kilogrammes (1,102 pounds) is used for 15 seconds. The hardness of the material is measured by dividing the pressure on the ball in kilogrammes by the superficial area of the indentation caused by the ball in square millimetres.

Expressed in formula $H=\frac{K}{d}$, in which

H=Hardness.
K=Pressure on ball in kilogrammes.
d=Superficial area of depression in square M. M.

This test is specially adapted for almost all materials used in engineering construction. It gives good results with woods, and has, since the introduction of light portable machines, become the most generally employed of all the testing devices.

Shore Rebounding Test.

In the Shore rebounding test, an instrument which has been named the "Shore" scleroscope, allows a small cylindrical steel hammer with a specially hardened point to fall on to the smooth surface of the metal to be tested, and the hardness is measured by the height of the rebound. The hammer weighs 2½ grammes (less than 1-10 ounce), and falls 255 millimetres (about 10 inches). Its striking point is a special diamond, annealed to withstand shocks, having an area of about 0.02 sq. inch. The hammer falls in a glass tube, in which it fits freely, yet snugly. This tube is divided into 140 spaces, which are numbered from the bottom upwards, and the number of the division, to which the hammer rebounds after its fall, represents the hardness of the material being tested.

This method is extremely simple and rapid, but it was not in its earlier stages altogether reliable, for experiments showed that the results varied with the size and thickness of the test piece, also with the manner in which the test piece was supported. Again, indiarubber gave a rebound equal to mild steel, and soft white pine wood a rebound twice as great as grey cast iron. At the same time, a comparison of results obtained from pure metals in their normal condition by this method with those obtained by the methods of Turner and Brinell showed a remarkable agreement. It would, therefore, appear that each instrument must measure the same property. Modifications and improvements in the more recent instrument have, however, now enabled it to be used successfully on a wide range of material, and in certain industries, notably automobile and tool making, it is considered by many to have no superior.

Applicability to Machine Design.

It requires but little reflection to convince one how important will be the proper application of the information obtained by those methods to shop practice. In practically every machine built, certain parts slide or revolve in contact with others, and it is of great importance that the cheaper and more easily renewed part should wear out first, especially should lubrication fail, and it is only by making that cheaper part slightly the softer that this result can be achieved. A little experimenting, testing and recording would enable an exact standard or ratio of hardness to be fixed, by which the danger of unduly wearing, cutting or scoring the more expensive parts of a machine may be minimised.

Another application of these methods has enabled us to determine the ratio of hardness of the cutting tool to the work to be machined. This, to give the best results, has been found to be 3 to 1, and has enabled tool makers to temper their tools with a certainty of obtaining from them the highest efficiency.

Application to Cutting Tools.

As an example of what may be accomplished along these lines there may be quoted the particularly interesting experience of a large firm of threading tool manufacturers in the United States. This firm had supplied to one of their customers a parcel of taps to be used in a turret lathe on very tough bronze. One of these taps turned out to be a perfect "jewel." It held out for 18 days at the rate of 10,000 holes per day, and was then returned to the makers with a request for more like it.

The manufacturers submitted it to a scleroscope hardness test, and then proceeded to make 50 taps from the same stock steel, and hardened to exactly the same value. The whole were then sent to the users with a request to put them to work and watch them carefully. Each tap proved to have the same efficiency as the "jewel," and the firm now undertake to produce the "jewel' variety of tap as a regular product.

Application to High-speed Steels.

Again, when applied to "high-speed" steels the hardness test is of great value. The efficiency of these steels depends largely on the fact that at temperatures at which carbon steels would lose their temper they retain a high degree of hardness. In their cold state, their hardness value is about equal to well hardened carbon steel, but the heat developed by high speeds and heavy cuts may succeed in lowering this hardness below that ratio of 3 to 1, which is necessary to do economic cutting.

It is quite possible to test high-speed steels for cutting efficiency under those temperature conditions which will obtain in actual practice by heating small samples of the steel in question to temperatures of from 600 to 1,000 degs. Fah., and testing for hardness at frequent stages. Thus the effectiveness of a steel may be accurately determined even before purchasing. In those engineering parts which are made from carbon or alloy steels, and hardened, tempered or annealed, such as gears, sprockets, balls, rollers and other bearing parts, the intelligent use of comparative hardness tests affords a certain means of obtaining the best results, and high-class manufacturers of these specialties are now among the largest users of testing devices in one or other of the forms described. Also, structural ironworkers and bridge builders are using them with success to determine if a material is too brittle to be trustworthy.

The scleroscope gives exceedingly good results with carbon, and is extensively used by electrical engineers to determine the suitability of dynamo and motor brushes for the particular work for which they are intended, and also to insure uniformity in lamp carbons.

Impending Tariff Changes in the United States

Many additions to free list which will interest Canadian Exporters. Terms of the new act as agreed to by the Democratic caucus and in which form they are likely to pass.

CANADIANS have reason to watch carefully the progress made with the new tariff bill of the United States. That measure has now reached the form in which it is likely to go through. It has been passed upon by the Democratic caucus, which means that numbers of the party in the Senate are committed definitely to the main terms of the Act, saving one or two unimportant particulars in connection with which independent action is reserved. The changes made by the Senate Committee on Finance place the following items on the free list:

Par.	Item.
401	Beet and cane machinery.
403½	Alizarin and derivatives.
404	Perchlorate of ammonia.
404½	Antimony ore.
416	Plain woven fabrics of jute.
427½	Blankets worth less than 40c per pound.
434	School text books and material for the blind.
450½	Cast iron pipe.
452½	Cement.
460	Creosote oil.
481½	Glaziers' diamonds.
486	Crude artificial abrasives.
492	Flax, tow and hemp.
496½	Fulminates.
496¾	Undressed furs.
505	Chip amber.
505½	Gunpowder.
515	Indigo color.
522	Pig, wrought and waste iron, slabs, blooms, etc.
534	Sole leather, harness, etc.
537½	Asphalt and bitumen.
559	Shoe machine needles.
580½	Photographic films, not exposed.
584	Cyanide of potash.
598	Santonin combinations.
609	Cyanide of soda.
615½	Steel ingots.
618	Strychnine compounds.
621	Cattle, sheep and other animals.
646	Wheat, flour, etc.
652	Goat hair.

This does not necessarily mean that these articles can be exported from Canada to the United States free of duty. Wheat, flour and bran, for instance, cannot be shipped to the United States free of duty so long as Canada's tariff wall against said commodities is maintained. Australia, Great Britain, or India, which import flour free may export the same to the United States. They can also export wheat to the United States free of duty. This will create a condition of affairs which will be awkward for Canada. As yet, however, the bill is not finally law. If it does become law in the present form it will certainly give rise to a tariff question in Canada that will have serious commercial as well as political consequences. The chief changes made by the United States Senate Committee, in the tariff bill are as follows:

CHIEF CHANGES IN U.S. TARIFF.

SCHEDULE A.

Par.	Item.	House Rate.	Senate Com. Rate.
1	Gallic acid	4c	7c
	Oxalic acid	2c	1½c
	Pyrogallic acid	10c	15c

PULPWOOD PRODUCTION.

A REPORT on Canada's pulpwood production in 1912, issued by the Forestry Department, shows that the forty-eight pulp mills reporting in 1912 consumed a total of 866,042 cords of raw material, valued at $5,215,582. The quantity consumed shows an increase of 28.8 per cent. over 1911, resulting in an increased value of the output by 20.12 per cent., in spite of a reduction of 43 cents per cord in the average price of the raw material.

Pulpwood Cut.

The total cut of pulpwood in Canada in 1912 was 1,846,910 cords, valued at $11,911,415. Of this total, 980,868 cords, or more than 50 per cent. was exported unmanufactured to the United States. Had these 980,868 cords been manufactured into pulp in Canada, the value would have been $13,220,684. The actual price received was $6,695,833.

Canada exported in 1912 enough pulpwood to supply 54 mills of the average size operating in the Dominion at present. Every province, with the exception of Ontario, increased its home consumption of pulpwood last year. The increases were:—Quebec, 48 per cent.; New Brunswick, 14 per cent.; Nova Scotia, 18 per cent. The decrease in Ontario was 18.6 per cent.

Local Manufacture.

In 1911, only 44.2 per cent. of the pulpwood cut in Canada was manufactured into pulp in Canadian mills. In 1912 this percentage was increased to 46.9 per cent.

MACHINE TOOL NOTES.

IT has been suggested on many occasions, says the Machine Tool Engineer, that a profitable piece of work for any machine shop would be a record of the time and money expended in repairing the various tools used, and the number of hours the tool was out of service due to repairs. By this means, it would be possible to make a comparison of the different machines used for the same kind of work, that, when ordering, some useful guide would be found in making the right choice or selection. This record would be very simply made, and would not involve any extra clerical work of importance.

Life of a Machine Tool.

The difficulty with the unpractised or unskilled and even the skilled person who controls a machine shop as an employer of labor, is to understand when it is time to consider a machine tool's profitable life at an end. The tool will probably last, to use a vague expression, for ever, that is to say, it will probably never fall to bits, and will always enable some kind of work to be performed upon it. Hence, though the machine may have been depreciated till it stands at nil in the balance sheet, it will probably be used for another twenty years, before serious thoughts are entertained of replacing it. Plenty of machines run thirty or forty years, and do their allotted jobs, so the employer does not think it worth while to get rid of them, but this seems to be a foolish policy.

Demonstrating the Points of a Machine Tool.

We agree with the view of a leading contemporary that every machine shop should keep one or more persons for "showing" the shop and demonstrating machines and their capabilities to probable customers. In many ways, a machine shop should be an advertisement for its production. To a skilled inquirer, who walks round the shop to see how things are done, the lack of system or the appearance of want of organization may give a poor impression as to the quality of the work turned out. A good demonstrator will be able to expatiate upon interesting points in design, upon possibilities in manufacturing processes, but he must not be a talker only, but a man who can talk with a degree of authority based upon personal knowledge and experience.

Plenty of shops do not use the tools which they make, for performing in their own shops the very operations for which such tools are designed. To give a demonstration, it is necessary to get a special tool ready. This does not seem to speak well for the firm's faith in the economy effected by using the tool. The demonstrator would have a poor time, if he began speaking of the economy effected being sufficient to warrant the scrapping of the old type of tool for the particular purpose and submitting his firm's special tool.

The Theory and Practice of Screw Cutting on the Lathe

By J. Davies

The author of this series of articles intimates his intention of making the information sufficiently simple and clear, that apprentices and others with the four rules of arithmetic at their command will be able to intelligently grasp the data and apply it in practice.

HAVING determined the ratio, a number of different sets of gears may be found by multiplying the ratio by any number we choose, although care must be taken to multiply both numerator and denominator by the same figure, so as not to alter its value. Examples:

Find wheels to cut 4 threads per in. with a leading screw of ½ in. pitch.

Threads ¼ in. pitch of leading screw ½ in.

Invert pitch of lead screw and multiply, then $\frac{1}{4} \times \frac{2}{1} = \frac{20}{40}$

Find wheels to cut 3 1-7 threads in 2 1-5 inches, with lead screw ½ in. pitch.

$$\frac{\text{Inches } 2\ 1\text{-}5}{\text{Thrds } 3\ 1\text{-}7} \times 35 = \frac{77}{110} \times \frac{2}{1} = \frac{144}{110}$$

Divide both numerator and denominator by 2 to reduce the size of the gears, then 72-55 will be the wheels required.

It very often happens that a lathe has a gear wheel permanently or tightly keyed on to the spindle, and which would be troublesome to remove. It is seldom necessary, however, to remove this gear, as other gears can be got to suit it as follows:

Find wheels to cut 10 threads per in., leading screw 4 threads per inch, with a permanent 30-tooth gear keyed to the lathe spindle.

Find ratio as before, $= \frac{1}{10} \times \frac{4}{1} = \frac{4}{10}$

$$\frac{4}{10} = \frac{30 \text{ permanent wheel.}}{x \text{ or wheel required.}}$$

$4x = 300\ x = 75$, therefore, wheels required = 30-75.

In changing the lathe from one pitch to another, it is easier and quicker to put down a few figures and work in as many of the same gears as possible, than to strip the lathe and put on an entire new set. Sometimes you will meet with a lathe that has a gear keyed on the spindle inside the end bearing, meshing with another gear which runs on a spindle through the frame.

As these gears are practically fixtures, they are invariably made a definite proportion to each other, usually 2 or 3 to 1.

In cases of this kind, multiply number of threads per inch in the leading screw by the ratio of the fixed gears. That is, supposing your lead screw has 5 threads per inch, and the ratio of fixed gears is 2 to 1, then figure the fixed gears and assume that the leading screw is 10 threads per in. and work out as before.

Compounding the Gears.

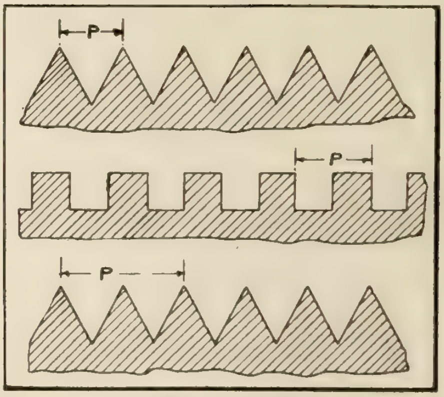
Sometimes it happens that the number of teeth in a wheel would be too large to employ a single train; in this case, compound gears must be used.

Example, it is required to cut 24 threads per inch with a leading screw ½ in. pitch. Proceed to find ratio as before.

$$\frac{\text{Inches } 1}{\text{Thr'ds } 24} \times \frac{2}{1} = \frac{2}{24}$$

Take the numerator of the ratio and find any two numbers which multiplied together will equal that number. Then take the denominator and find any two numbers which multiplied together will equal that number .

$$\frac{2}{24} = \frac{2 \times 1}{12 \times 2}$$



PITCH DIAGRAM.

Having divided the ratio up into 4 factors of the same value, we can now multiply, divide, add or subtract at will. so long as we do not alter the relative values, therefore, in adding or subtracting, care must be taken that the amounts added or subtracted are the same proportionate amounts of each, such as ½, 1-3, ¼, and so on as the case may be. Take the first two figures our example and multiply each of them by ten. We have $\frac{2}{12} \times 10 = \frac{20}{120}$. Take again, the second figures and multiply by 50, then $\frac{1}{2} \times 50 = \frac{50}{100}$, and the wheels required are $\frac{20}{120} \times \frac{50}{100}$.

The top wheels are drivers, and the bottom driven.

Prime Number Method.

If the thread to be cut is exceptionally difficult, or if you are doubtful as to whether you can get any combination of wheels to cut the pitch required, try this method of using prime numbers.

Prime Numbers, 1 to 500.

KAMINISTIQUIA POWER DEVELOPMENT.

INTERVIEWED by the Fort William Times-Journal, Mr. R. S. Kelsch, consulting engineer, Montreal, stated that his recent visit to Fort William was in accordance with instructions from President Holt of the Kaministiquia Power Co.

Owing to the general conditions throughout the country, it was felt that the company should, if found advisable, carry out as much as possible any contemplated constructions, during the next twelve to eighteen months, while the financial stringency was general and for that very reason, where work would be slack elsewhere and factories not running up to capacity, the plant could be installed at a very material saving and economy over what it could be done for two or three years later.

Making Surveys.

At the present time the company are making preliminary surveys, putting camps in shape, and in general anticipating an order to go ahead as soon as Mr. Kalsch can submit his report on the engineering advantages and dependent on Mr. Black's recommendations.

It will be appreciated that under existing financial and general conditions the company will hardly proceed with the outlay of such a large expenditure of money as would be involved in the carrying out of the proposed plans except after the most careful considerations.

With reference to the size of the new units, these would either be two of the same size at the present, viz., 5,000 horse power, or else one single unit between 10,000 and 15,000 horse power, whichever appears most advisable.

In the face of power failures elsewhere it is being better generally realized that where a community depends to such an extent as it does on electric service, the most important factor is that of continuity of service.

The Hydro Failure.

In the case of the recent unfortunate mishap to the hydro service in eastern Ontario it has been estimated that the loss to the community served, in lost time and inconvenience, to the public, was upwards of one hundred thousand dollars, and this feature must ever have the very best and closest attention of our consulting engineers, our operating organizations and our directors, having a proper regard for the public they serve.

While the present work is somewhat in advance of the immediate necessities, it but carries out the past policy of the company, to at all times maintain ample reserve equipment and assure the best possibly service.

Take Pride in Plant.

Mr. Kelsch referred to Mr. Holt's pride in their Kakabeka Falls plant, which Mr. Holt considers one of the very best of its kind and size anywhere on the continent, and holds the record for that standard of service which they have endeavored to secure. It is interesting to note that the management and local organization is practically the same as that from the commencement of operation in 1906.

It has always been the policy of the company to promote its men in the service, and to become a live factor in the life of the community which they serve.

Loyal to Fort William.

All their work is carried on by the company, supplies purchased locally as much as possible, and as all moneys are paid through the Fort William office, the expenditure that would take place would be of as much direct benefit as though the work were carried on inside the city limits.

While the company were preparing all the preliminary work and estimates no work on a big scale would be undertaken until their information was all in hand, nor would any definite decision be made until the return of W. A. Black, the managing director of the company, who is at present on his way from Europe, and is expected in Fort William in the course of the next couple of weeks. On Mr. Black's recommendations or otherwise will practically depend what the ultimate decision will be, but if favorable then the company would press forward all extensions as fast, and on such a scale, as the various conditions warranted during the next two years.

SCIENTIFIC SELECTION OF FOREMEN.

HARMONY between man and boss depends upon the proportion and nature of the positive and negative elements of character in each. An extremely positive boss will not work harmoniously with either extremely postive or extremely negative men—and conversely. As to disposition, there are several types of executive, two of which, very commonly met with, may be analyzed as follows:

Positive—or Driving.	Negative—or Drawing.
Keen	Mild
Quick	Deliberate
Domineering	Persuasive
Changeable	Constant
Impatient	Patient
Opinionated	Teachable
Excitable	Calm

The positive driving type, if given men of his own degree of positiveness, will arouse antagonism and insubordination. The negative type, if given men of his own disposition, will fail to arouse enthusiasm and stimulate action. Give the positive boss men several degrees more negative than himself, and the negative boss, men several degrees more positive than himself, then the result is harmony. Educate the boss, in addition, to apply the principles of efficiency to the job, and the principle of character analysis to his men, and the problems of management are solved. This is the ideal.

In practice it is slow work to enter an organization already established and adapt these principles—and plans based upon them—to conditions and traditions. In a large manufacturing plant, employing about 2500 men and women, we have been striving toward this ideal for six months. The results obtained are good, but as yet far short of our ultimate expectation. Certain small economies have, however, been effected in all parts of the plant to inspire us to continued and greater effort.

A Concrete Example.

One example, taken from our experience in connection with the crudest labor in the organization, will suffice. When we began work, the yard gang of 123 men was commanded by a brilliant, dashing, intensely likable young foreman who, because of these qualities, was popular throughout the organization, and held the confidence of his superiors. Coming under observation of one of our experts, he was reported to be unreliable and undesirable in several respects. Careful investigation of his department revealed many irregularities.

A successor was scientifically selected and assigned for this work, and, through co-operation with the efficiency department and executives of the company, he effected the following economies: During the last three weeks of October, the former foreman kept an average force of 123 men, with an average payroll of $1,823.46. The production consisted of heavy machinery, an average output of 62 units a week. During the last week in January, after the new foreman had been in charge three months, the average number of men was 51.8, and the payroll for the week $639.25. The production was 122 units; the reduction in cost per unit was therefore $28.53. The actual payroll during the last week in October, 1912, was $1,688.30. The actual payroll for the last week in January, 1913, was, as I have said, $639.25, showing a reduction in the payroll per week of $1,049.05.

If the present efficiency is maintained for a year, the economy effected, in this one department, will amount to $54,550.60, and the production, if maintained at the present rate, will be practically doubled. Since such economies can be effected through scientific selection and assignment in the lowest and cheapest grades of employment, what can be, and is being done with higher executives and more skilled labor by the same methods is so revolutionary that I dare only challenge your imagination as to facts and figures.

Observations from an address delivered by Dr. Katherine M. H. Blackford of the Emerson Co., before the Western Economic Society, Chicago, and which appeared in a recent issue of the Iron Age.

INTERNATIONAL STEEL CORPORATION LTD.

Letters patent have been granted incorporating the International Steel Corporation, Ltd., with a capital stock of $100,000, and head office at Toronto. The incorporators include D. A. MacRae, T. W. Lawson, H. E. McKibuck, barristers.

Discussion of Some Phases of the Efficiency Movement

By Staunton B. Peck[*]

There is no gainsaying the fact that the efficiency movement has come to stay, and that its operation and ramifications are contributing to high degree results. Its progress and development are shown by the writer of this paper to be dependent on a combination of conditions in which employer, superintendent, foreman and operator must each and collectively bear a part.

EFFICIENCY results essentially from analysis and close attention to details; but here I will only touch upon some of the more general phases of the subject.

The development of the highest efficiency is the purpose of Scientific Management, a subject much discussed and written about, but still very imperfectly understood. Two very widely divergent ideas are generally prevalent; one that all systematic plans of increasing efficiency are more or less impracticable theories involving much expense, disorganization and red tape; the other that efficiency and increased profits follow in some rather mysterious fashion as the result of putting in force a code of rules,—as one would benefit from following a system of calisthenic exercises. These views divergent as they are, have both received justification by the crop of efficiency and system experts, with little or no practical experience, who have sprung into existence in the last few years; and unfortunately, too, from some who have a real practical knowledge, but who lack commercial sense; and in their zeal to develop the highest productiveness, lose sight of the all-important fact that the aim of every business man is to make a profit.

The Taylor System.

The evolution of a better, or more correctly speaking, the best system of production, was begun some thirty years ago by Mr. F. W. Taylor. The progress for a long time was slow, attracting but little attention, for he sought to establish definite facts with characteristic patience and thoroughness. Any discussion, therefore, of the principles of efficiency involves the consideration of the "Taylor System," or Scientific Management as he prefers to have it called, because Mr. Taylor was the first to go to the root of the matter, covering the ground exhaustively, and, in fact, occupying the same position in relation to it that Darwin does to the Science of Evolution. All other plans are based on Taylor, however much they differ in their development.

Inadequate Supply of Unskilled Labor.

The widespread interest in the subject in the last few years has undoubtedly been stimulated by the inadequate supply of skilled labor—a condition never more apparent than at the present time, and particularly in the foundry, and without analyzing all the reasons for this, we do know that in this country the skilled artisan, instead of seeking to bring up his son to excel in his trade, aspires to have him follow what he falsely conceives the higher occupations of office, drafting room or counting room, where he can have clean hands and wear a white collar. This scarcity of labor leads us naturally to endeavor to get the greatest efficiency out of what is available. There can be no doubt of the desire of every manufacturer to realize a high degree of efficiency in his plant, and every one has sought to attain it—some consistently, but most of us in a more or less uncertain and rambling fashion.

Degrees of Efficiency.

The same degree is not possible to all as the nature of the product will determine. Where there are relatively few things made, but these are made in large quantity, a greater measure is possible than where the product is greatly diversified. While relatively few plants may advantageously adopt comprehensively the Taylor System, a thorough study and grasp of its fundamental principles by those in authority, will unfailingly result in a broader and wiser policy; for these principles are universally applicable; and there are few plants that cannot make advantageous practical use of some of the methods of increasing efficiency growing out of them.

The value of some of these methods has long been recognized, and has led to their adoption in many plants. Particularly is this true of the incentive schemes for paying men,—variously known as piece work, premium and bonus plans. To many, this is the main and all important element in efficient management; nevertheless, this element is relatively unimportant; and not only this, but time and motion studies, divided or functional foremanship, accurate cost and stock keeping plans, and all of what may be called the machinery of the system.

The Co-operation Feature.

Between this machinery and the real system itself, there is a clear and positive distinction which is not generally appreciated by many who are fairly familiar with the practical methods, and which, if not clearly kept in mind, is and has led to failure, discouragement and abandonment of attempts at betterment. This essential feature which must exist in the system which aims at the highest efficiency, is a spirit of friendly co-operation on the part of both workman and management—a real belief which manifests itself by act, on the part of each, that there is no antagonism between them, but that they have a common interest, and that they are indissolubly bound together in success or failure.

Now I think we all of us know that before this feeling exists, there must be a complete mental revolution on each side; for even although the relationship between men and management may be friendly and even cordial, the universal feeling up to the present time has been that their practical interests were of necessity antagonistic. There is no doubt of the general prevalence to-day of an innate, perhaps, partly unconscious desire, on the one side to get the most return from the workmen for the lowest wages, and on the part of the worker to give the least return. These mental attitudes are the development of generations under the old system, and are so thoroughly widespread and ingrained, that only by patient and persistent effort can they be changed. In such measure as this new mental attitude exists on both sides, can the greatest efficiency be realized.

Traditional Methods and Individual Opinions.

The second fundamental principle of Scientific Management is the recognition and acceptance on both sides of the fact that exact knowledge of the manner and time in which work should be done, must replace traditional methods and individual opinion of either worker or foreman. All the disappointments at failure to realize anticipated results from the adoption of better methods, can be directly traced to imperfect appreciation of one or the other or both.

As I have said, the element of efficient operation of which there is the most general knowledge concerns the manner of paying the workmen; and the first step usually undertaken towards increased efficiency, is the introduction of some one of the piece rate plans, or plans where an increased production by the worker earns increased pay. Now unless what constitutes a fair days' work is based on accurate knowledge of the machine or tools with which the man works, and the motions he uses to accomplish his work, the task set is going to be wrong in the majority of cases. This knowledge can only be obtained by the thorough study of the tools by trained men to be sure that their various functions are properly co-ordained, and to determine their capacities; and by a large number of time and motion studies, with stop watch, of the men, for the purpose of eliminating the useless or waste motions, and obtaining records that are fair to the average worker.

---

[*] Of the Link Betz Co., Chicago.

Impatience to Attain Results.

The criticism that I think may be broadly made of American factories is a certain impatience, an over-intensity and eagerness to attain results, which causes lack of thoroughness. This is but a natural result of our phenomenal prosperity, and a desire to make the most of our tremendous opportunities in the shortest space of time. Those of us who are willing—and many are not—to bear the expense of the proper preparation of data necessary to the introduction of efficient and permanent incentive wage systems, still begrudge the loss of time required to do it.

Now, if these piece-rates—I use this expression in a general sense to cover all these wage plans—are not right, two results follow, or rather one result—inefficiency—from two causes. If the day's task is too easy, the workman earns too much, until the management cuts the rates, and then systematic soldiering follows thereafter throughout the plant, to avoid earning excessive wages, and to conceal the errors in rates. If the rate is such as to call for an excessive or impossible effort to earn a premium, no incentive is offered, and all attempt ceases. Both results foster the sense of antagonism on the part of the worker, fatal to any spirit of cooperation. The attainment of efficiency in production is shorn of its fruits, if unaccompanied by a corresponding efficiency in the sales organization. No single factor is of more value in promoting this than correct and dependable costs records; and these result automatically where correct piece-rates have been put in use that are properly determined and known to be absolutely right.

The Foreman A Co-Worker Feature.

Following a mental attitude on the part of management and worker which makes both fellow workers to a common end, and the acquired knowledge of the best methods of operation, there results naturally the effort on the part of the management to impart this knowledge to the workman and assist him in every possible way to work to the best advantage. This subordinates the idea of the foreman or superintendent as a boss or driver, to that of a teacher or co-worker. Such relation may often be found in a small factory, where the owner or boss is a practical man, and every one is under his immediate eye and direction. His methods may be fairly efficient, because the operations are so comparatively few that experience has supplied him with reasonably accurate data not beyond the capacity of his memory to record.

A general foreman, or superintendent, however, is called upon for a number of duties which are radically different in character and which are rarely performed equally well. He has to hire, discipline and discharge men; (an old New England Superintendent said half the art of management was in hiring and half in firing); to direct the men in their work, and the actual factory operation; to be the inspector; to assign the work and keep track of its progress through the factory; to look after the physical condition of the plant and equipment, and the expansion of both.

Small Shop Growth.

The first loss in efficiency then usually begins when the small shop which has been well-handled begins to grow as a result, and its management gets beyond the capacity of one man. As I have said, the superintendent rarely performs all of his various duties equally well. If he is of a methodical temperament, his keenest interest will be centered on planning the distribution of the work, its progress through the factory, and its completion by the shipping date. If he has a distaste for such work, he will naturally prefer to spend most of his time on the floor directing the actual operations. In either case, with the growing business, one or the other is neglected. Mistakes and poor work results in one case, and delay and confusion in progress of the work in the other.

The Superintendent Feature.

The customary step toward keeping up the efficiency of the growing plant is to provide the superintendent with an assistant, usually a younger man who has all the qualifications of the superintendent, but presumably in a lesser degree, and who performs all the same functions, merely relieving the superintendent of the less important details of each. The better plan, however, is a definite division of the superintendent's functions among as many different assistant superintendents or foremen as the size of the business will justify. If this course be followed, the big concern is in the way to become the most efficient one.

That the opposite is frequently the case is because with rapid expansion the management gets further and further from the shop, and endeavors to bridge the gap by superintendents, assistant superintendents and general foremen, each required to have knowledge of a great many things, but not a specialist in any one. This may result in output, but not efficiency. The latter cannot be secured by a large number of superintendents with general knowledge, but does result from foremen with highly specialized restricted duties, each one being chosen for his natural interest and aptitude in his particular field.

There is frequently encountered a serious obstacle in the opposition on the part of many a capable superintendent and foreman, who openly or secretly resents the relinquishment of any of his functions, feeling his position and authority are thereby lessened, yet, to the average busy superintendent, if he can be made to view the change in the right spirit, the assistance, for example, of a production clerk who assumes the entire responsibility for the distribution of the work and following it up, is a vast relief and an aid to efficient effort in his other duties. So, too, for example, the foundry superintendent's efficiency may be increased by relieving him, where the growth of the output permits, of all responsibility for the mixture of the iron and the melting.

It must be remembered that true scientific operation imposes definite responsibilities in the matters of co-operation, investigation and instruction on the management, to which the same consistent obedience is required as of the worker to his duties. If those in authority chafe under this and fail to do their part as faithfully as the men the efforts of the latter will proportionately fail to achieve results. It may safely be said that opposition wherever found is due to ignorance.

We read a great deal about the high cost of living, and get a very practical reminder of this every month. We read many explanations, and not so many suggested remedies. Those of us who know something of labor conditions, I think, agree that the most important contributing factor is the persistent pressure of the labor unions toward high wages, shortened hours and restricted output. The leaders of these unions will not permit themselves or their followers to see that labor enters largely into every product that labor itself has to buy, and that every decrease in efficiency and increase in wages keeps working in a cycle to increase the cost of the necessities of life. The only practical way to decrease living costs and to enable the workman's wages to buy more is increased efficiency of all his fellow-workers. The more economically an article is produced, the more people can use it, the greater the demand for its production, and the more producers required. This is in direct variance to the short-sighted but general belief of the working man, that the demand for any article is fixed, and that the less each man does the more men are employed. There is no fixed demand; on the contrary, inefficient labor by increasing costs decreases the demand and throws men out of work.

A Matter of Education.

Education, therefore, in correct economic ideas, which is best brought about through fostering the co-operative spirit throughout a concern, is a sure step toward ultimate efficiency, and it is to be regretted that many influential in various walks of life—Congressmen, writers, pastors and others, who occupy a natural and outside position, do not give more thought and study to acquiring and disseminating correct ideas. The good they could accomplish is incalculable, but, unfortunately, most of them never go beyond the superficial conception that the interests of laborer and employer are essentially antagonistic, and that all attempts at increasing efficiency are but means to grind the last ounce of effort out of the worker, to his mental and physical destruction. Those who are practical students of efficiency know to the contrary that its highest attainment comes from men working well within their capacity, and that periods of rest depending on the character of the work are as essential and as definitely provided for as the periods of work.

It should be kept in mind that, while the operations of the efficient worker may be made as regular and uniform as that of a machine, no man is a machine merely; and even the least intelligent have human feelings and desires which demand not merely the physical necessities of a roof, a bed and three meals, but some of the good things of life as well. As this human element enters into the wages, therefore, and must be paid for, it is a waste product unless the employer can find some means of utilizing it. There can be no outlet so mutually profitable as converting it into pride in work well done, and a spirit of co-operation and loyalty, by safe, sanitary and comfortable surroundings, a touch of skilled and cheerful assistance in aiding the performance of duties, and personal interest and appreciation from time to time on the part of those "higher up."—From a Paper read at the National Founders' Association Convention in New York.

* * *

BURNING ANTHRACITE DUST.

THE usual practice when burning anthracite dust in connection with bituminous coal is to use a certain number of barrowfuls of dust with a given amount of soft coal, the proportions being varied in different places, and depending almost entirely on the experience of the fireman or engineer. Where the boilers are hand-fired, two or three barrowfuls of soft coal are dumped on the boiler-room floor, and over this is spread one or two barrowfuls of dust, the shovelling of the mixture into the furnace being depended upon to form a more intimate union of the different grades of coal. In some cases water is sprayed over the mixture before it is fed to the furnace.

There is no hard-and-fast rule as to the amount of water to use in wetting down the pile of dust, but it will be found that the mixture when wetted before being fired is better enabled to hold a lump shape, and this permits coking, which produces a more favorable condition for burning the dust. Whenever the mixture is fed to the furnace dry, there is little tendency toward coking; hence a smothered fire is produced, and poor combustion is the result.

It is evident, therefore, that the object of wetting the dust is to produce a lump formation which will facilitate coking. The best proportion of dust to use with soft coal is one that will effect a rapid dissipation of smoke, and at the same time maintain satisfactory steam pressure.

* * *

GERMANY'S TRADE.

GERMANY has made prodigious strides in commerce and industry since 1888, and much statistical information showing these increases has been published in connection with the celebration of Emperor William's quarter century on the Throne. It is now claimed that Germany is ahead of England as a producer of merchandise.

In the last twenty-five years, Germany's imports have risen from $818,000,000 to $2,541,000,000, and her exports from $798,000,000 to $2,146,000,000. This foreign business affected shipping as follows:— Tonnage movement in 1888, 42,000,000 tons; in 1912, 137,000,000. Coal, including lignite, was produced in 1888 to the extent of 81,000,000 tons; in 1912 the figures showed 259,000,000 tons. Crude iron produced in 1888, 4,300,000 tons; in 1912, 17,800,000 tons. Imports of raw cotton show equally interesting figures: 913,000 bales in 1888, as against 2,276,000 bales last year.

Germany's great electrical industry has almost been created during the past twenty-five years, and the leading electrical manufacturing company of the country has increased its capital strength more than twenty-fold since 1888.

* * *

DURABILITY OF TIES.

THE average life of untreated ties as reported by the steam roads is as follows:—Cedar, 9 years; tamarack, 8 years, hemlock, 7 years; Douglas fir, 7 years; jack pine, 6 years; spruce, 6 years. As recent statistics bear evidence, cedar is the species principally used, because of its durability, but the supply of cedar is rapidly becoming exhausted. Unless preservative treatment of ties is introduced, the short-lived species will have to be used untreated, which, on account of the necessary frequent renewal, will increase the cost of mileage maintenance. If treated ties were used, which would cost 30 cents extra per tie for creosoting and equipping with tie plates, the inferior species, which are very plentiful and cheap in Canada, could be used with economy.

With such a treatment, these woods would last at least 15 years, and if protected from wear would probably last much longer.

* * *

SQUIRREL CAGE TYPE MOTOR.

THE squirrel-cage type motor easily holds the field for general work in the cement mill. A good method is to have a combination of group and individual drives, grouping all the heavy machines and using small motors for the lesser drives, such as conveyors, elevators, etc. The choice of frequency is not of very great importance; anything between 25 and 63 periods is suitable. Of greater importance is the choice of voltage.

With group driving, the 2,200-volt system can be installed to great advantage with perfect safety, but such is not the case with individual driving. The smaller machines should be driven at 550 volts as a maximum. The wiring is best carried out in the open principle, with everything in full view, this system being carried right up to the motor wherever possible.

New Development in Molding Machines for Shallow Work

"Engineering"

With a view to meeting the special conditions imposed by shallow work, the machines here described have been introduced, and as a large section of our readers are engaged in this particular line of product, we are of opinion that the data given will be found specially interesting.

THE moulding of shallow work, especially round and oval pieces of small dimensions, such as fittings for saddlery, small rings, etc., and the moulding of rather large sections, consisting of numerous small parts, such as stove plates and other ornamental work, offers difficulties of a special character. For this class of work it is necessary to do away almost entirely with the joint fin, owing to the practical impossibility of chipping every casting. It is consequently of the first importance that the two half-moulds should be in perfect match. Shallow work can be made by hand processes at quite a fair speed and of good quality, so that if machine processes are to compete it is necessary that they should afford a rapid output and a good quality of work.

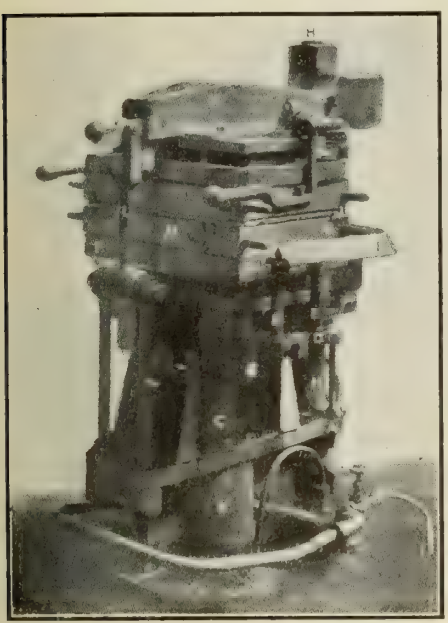

FIG. 1. MACHINE CLOSED FOR RAMMING.

Existing Methods Have Disadvantages.

There are numerous machine methods at present in use for the production of the shallow type of work with which we are dealing, but we think none of them can be said to be so perfect as to have no disadvantages. For instance, when moulding with separate pattern-plates for the cope and drag, it is extremely difficult to obtain a perfect match, while with a power squeezer the plates have to be made strong enough to withstand the whole pressure of the machine. A common method of working is by means of loose patterns on a sand match, but this is only practicable for simple classes of work. A feature of many methods of machine-moulding shallow work is that pouring has to be made on the flat. In many cases, however, it would be an advantage to be

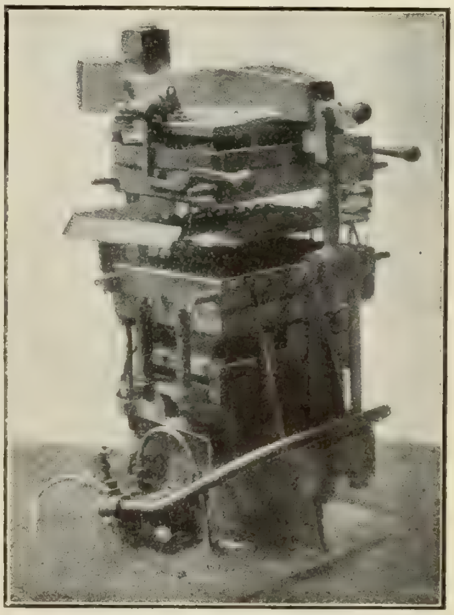

FIG. 3. MACHINE WITH DRAG LOWERED AFTER RAMMING.

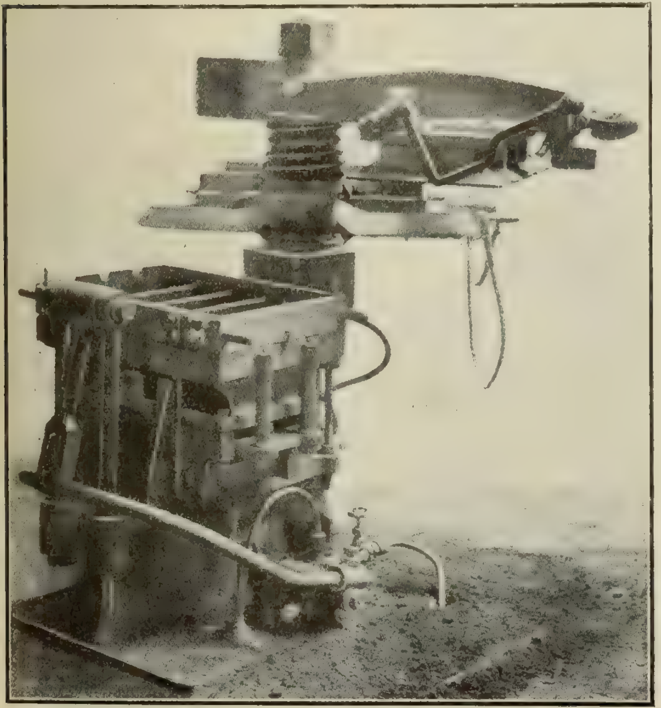

FIG. 2. MACHINE OPENED OUT FOR FILLIING FLASKS.

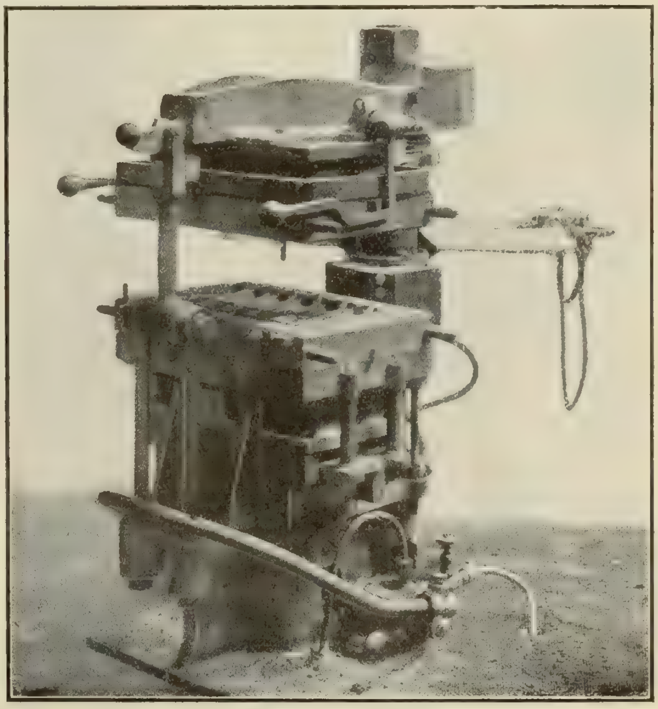

FIG .4. MACHINE WITH PATTERN PLATE SWUNG OUTWARDS, READY FOR CLOSI NG MOLD.

able to pour such castings on end; but apart from anything else, it is clear that this would frequently allow more castings to be put in a flask than is possible with flat pouring.

White Metal Pattern Plate Feature.

With a view to meeting the special conditions imposed by shallow work, the Societe Anonyme des Etablissements Ph. Bonvillian et E. Ronceray, of 9 and 11, Rue des Envierges, Paris, have introduced the machine here illustrated, the main features of which are that it is arranged so that both flasks can be filled simultaneously, and can be rammed together by a single stroke; that the pattern is drawn by the machine while the plate vibrates; and that it is possible to close the mould either for pouring on the flat or on end. Further features are that the machine is adapted for barred flasks, and can be used in connection with white-metal pattern-plates of about ½ in. thickness, which require no machinery work, and can be made in about the same time as a sand match.

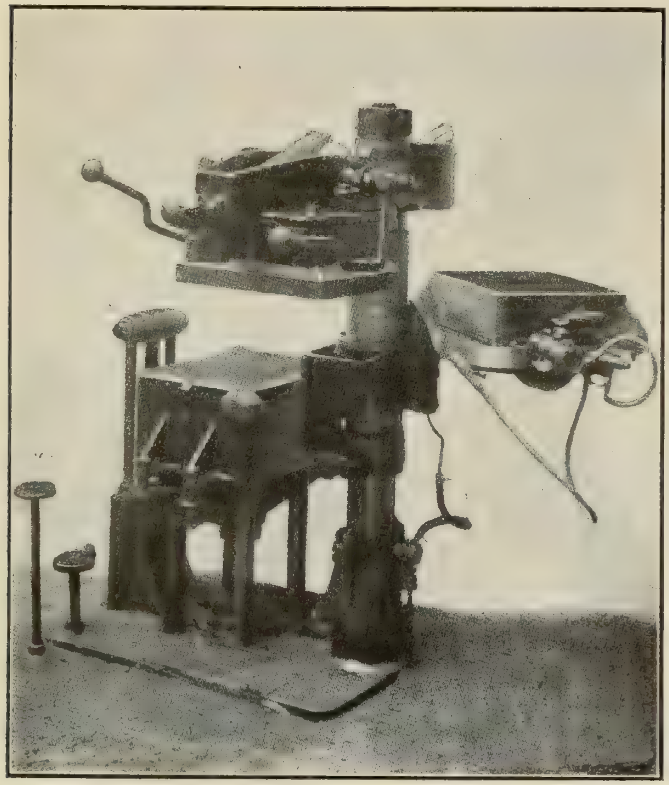

FIG. 5. MACHINE IN POSITION FOR FILLING FLASKS.

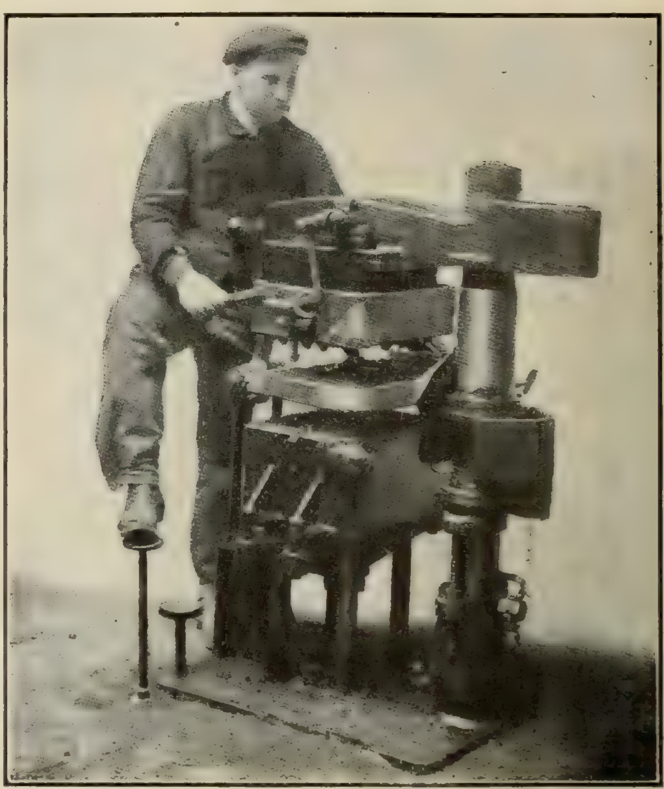

FIG. 6. PATTERN BEING DRAWN WITH VIBRATOR IN ACTION.

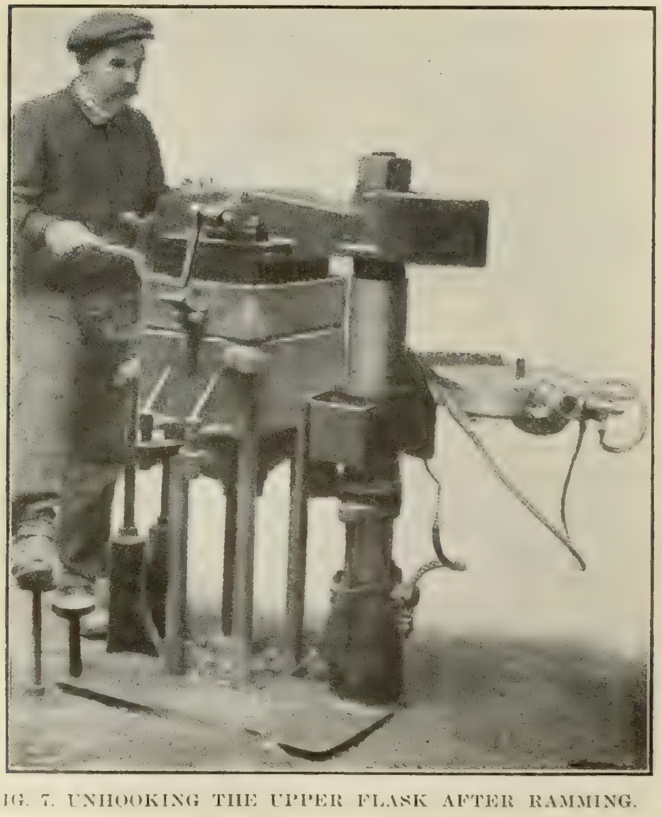

FIG. 7. UNHOOKING THE UPPER FLASK AFTER RAMMING.

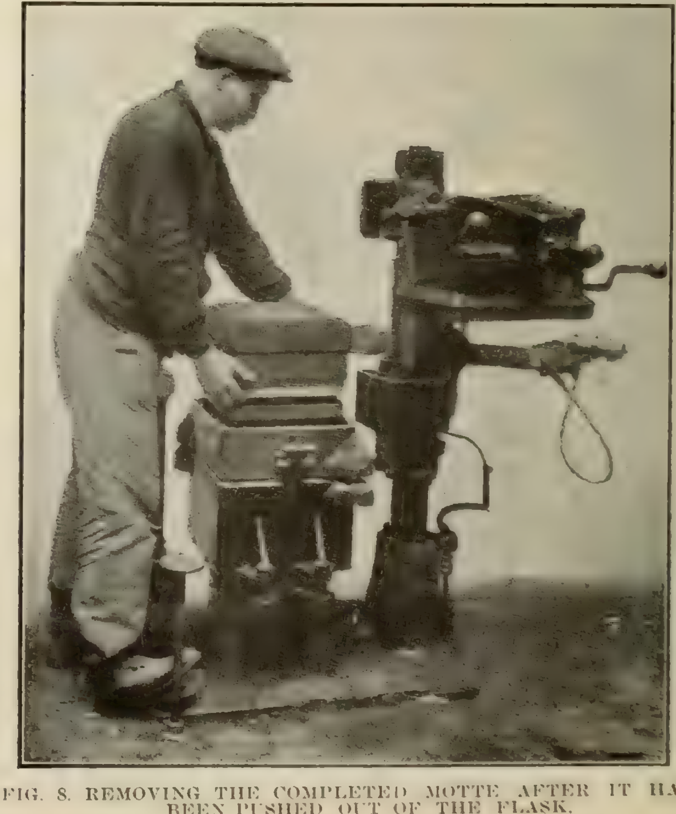

FIG. 8. REMOVING THE COMPLETED MOTTE AFTER IT HAS BEEN PUSHED OUT OF THE FLASK.

The employment of barred flasks with the machine allows comparatively shallow flasks to be used even for large sizes and does away with the necessity for weighting when pouring on the flat, or using a screw-press when pouring on edge, the latter process being rather a delicate one. The use of white-metal pattern-plates is, of course, a feature of Bonvillain and Ronceray's general practice, and they are employed in connection with the moulding-machines for more complicated work which are constructed by the firm. It may be said here that the pattern-plates are produced in a special flask on the machine itself from ordinary wooden patterns. After the impress has been taken in the sand, the two parts of the special flask are spaced apart by a frame which forms the outside of the pattern-plate when the white metal has been run.

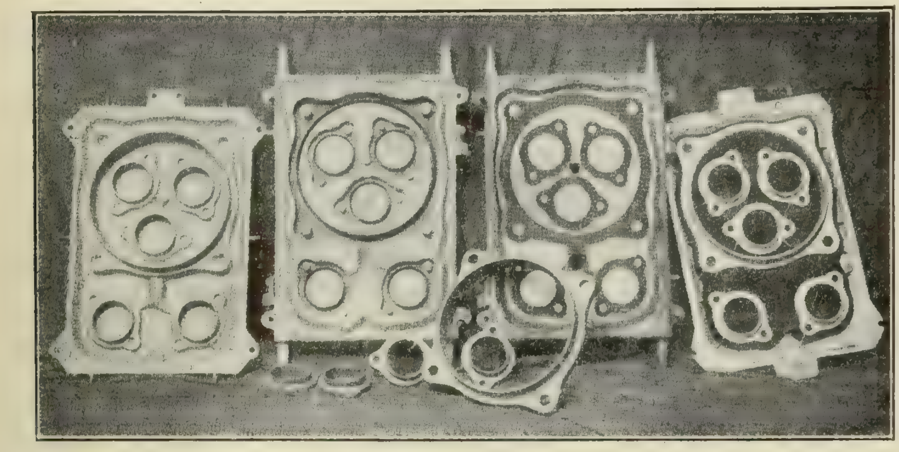

FIG. 9. PATTERN PLATE, MOLD AND DUMMY.

New Machine Features.

The machine illustrated is operated by hydraulic pressure, but has a compressed air attachment for the vibrator. If necessary, the whole machine may be worked by compressed air, and there are several plants of this class in operation. The makers, however, in accordance with their general practice, prefer hydraulic operation when possible. The various parts of the machine may be followed from Fig. 1. The base casting is formed in one part with the ramming cylinder (B), the ram of which is shown at C. Inside the main cylinder (B), a second smaller cylinder carrying a small ram is bolted. The object of the smaller ram is to enable auxiliary motions, such as bringing the flasks in contact and closing the mould, to be carried out quickly. The final ramming is done by the ram cylinder (B), and its ram (C). The smaller auxiliary cylinder and ram are under the floor, and cannot be seen in the figure. In addition to the two rams already mentioned, there is a small ram which is carried on the top end of the main ram (C). This ram is bolted to the plate (D), which carries the down-sand frame (F) by means of the rods (E), (E). This small ram is supported by air-pressure, and its purpose is merely to carry the down-sand frame on a flexible support. At one side of the machine there is a column (H), which supports a bracket (I), arranged to swing in a horizontal plane. This bracket carries the pattern-plate (J). The column (H) also supports the cross-beam (K), which can swing in a horizontal plane, and which can be fixed in position over the machine by the hook (L).

Machine Operation.

The working of the machine may be traced through by considering the cycle of operations to start with the various parts in the positions shown in Fig. 2. It will be seen from this figure that the bracket (I) and the cross-beam (K) are swung outward clear of the down-sand frame (F), and that the drag is in position on this frame. The cope is in position on the pattern-plate which is carried by the bracket (I). The condition being as above, the two flasks are filled with sand, one by each of the two men who attend the machine. The cope-man then swings the bracket (I) so that it comes in position over the drag, the drag-man meanwhile swinging the cross-beam (K) and fixing the hook (L) in position. The drag-man then presses down the treadle, which can be seen in the figure, and admits pressure water to the auxiliary cylinder which has already been referred to. The result is that the whole equipment is raised quickly, the pattern-plate being caught in passing by the drag, until the cope comes in contact with the upper ramming-plate. During this motion, the main cylinder (B) will have been put in communication with a supply tank and have been filled with water. By pushing the treadle a little further down, the drag-man now cuts off communication to the tank, and admits pressure water to the main cylinder. This completes the ramming, the position of the parts of the machine during this time being as shown in Fig. 1.

The next step is for the cope-man to start the vibrator, the position of which on the bracket (I), can be clearly seen in Figs. 1 and 4, and for the drag-man to hook the cope to the cross-beam (K) by means of the two hooks which can be seen in all the figures. The drag-man then leaves the treadle, and the ram (C) begins to fall, taking down the drag and pattern-plate with it. The pattern-plate is caught by the bracket (I), and the drag sinks away from it until the drawing is completed, and the machine appears as shown in Fig. 3.

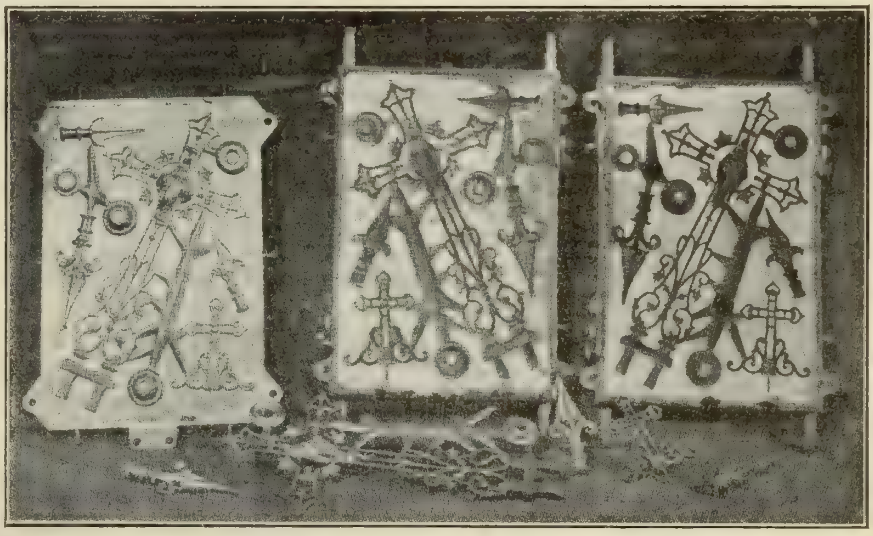

FIG. 10. EXAMPLE OF WORK PRODUCED BY MACHINE.

During the whole of the drawing the vibrator is in operation, but it is now stopped by the cope-man, who then swings out the bracket (I) into the position shown in Fig. 4. The drag-man then presses down the treadle again, admitting pressure water to the auxiliary cylinder. This closes the mould. The drag-man next unhooks the cope and leaves the treadle, and the completed mould sinks down, and is ready for lifting to the floor. The flasks before lifting are secured together by the small hooks which are fitted to them and which can be seen in Figs. 1 and 2.

The working of the machine is very rapid, and on an average it takes less than a minute to make a complete mould. A series of cinematograph pictures have been taken of the machine in practical work, during which the average time was 45 seconds. These cinematograph pictures have been analyzed, and the following table for the various motions compiled from them. At the time of the trials, the machine was using barred flasks 21½in. by 14½ in. by 2¾ in.:—

Moulder.	Seconds	Helper.	Seconds
Pick up drag and put it in place	1.9	Blow-off pattern-plate; swing sand-frame above cope, shake parting and riddle sand on pattern	10.4
Fill up drag (two shovelsful), and put sand in riddle	6.4	Fill up cope (two shovelsful)	6.9
Riddle sand on drag top	9.0	Strike off surplus sand	4.5
Strike off surplus sand	4.5	Swing on pattern-plate with cope on	7.4
Swing on the pressing-head and lock it	1.8	Start vibrator	5.6
Squeeze and hook cope	5.5	Swing out pattern-plate and put cope on	3.9
Draw pattern-plate and finish gate-holes with fingers	7.7	Lock finished mould	1.8
Apply pressure to close mould and unhook cope	1.9	Place mould on floor (on end)	4.5
Release pressure, spring out pressing head, and lock finished mould	1.8		
Place mould on floor (on end)	4.5		
	45.0		45.0

Weight of an empty shovel	6	lb.
Weight of sand in shovel	22	lb.
Number of shovels in each part of flask	2	
Weight of sand in two parts of flask	88	lb.
Weight of two empty parts of flask	82½	lb.

It should be noted that no automatic sand-distributor was used with these tests, the men shovelling the sand from a heap.

It should be noted that no automatic sand-distributor was used with these tests, the men shovelling the sand from a heap.

Machine for Moulding Shallow Woril.

It is, of course, clear from the foregoing description that the machine operates on a system which involves printing the drag. It may be thought that this will restrict its use to very flat work, but by means of what the makers call a dummy, the difficulty of printing deeper articles has been overcome to a great extent. The dummy is a metal form, made by moulding, which has holes corresponding to the projections of the mould to be made. An example of a dummy is shown at the right-hand side of Fig. 9.

The dummy in use is placed on the drag side, and sand is riddled on to it, projections of sand obviously being left in places corresponding to the openings in the dummy. In addition to the dummy, Fig. 9 shows the pattern-plate, the moulds, and the articles which are being produced. Further examples of the class of work for which the machine is specially suitable are given in Fig. 10.

Machine for Casting Mottoes.

A further machine of the same class as that just described, but adapted for casting in mottes, has recently been introduced by Bonvillain and Ronceray. It is shown in Figs. 5 to 8. The machine need not be described in detail, as its general features, as will be seen, follow closely those in the previous example. It, however, has an additional feature in the provision of a further lifting-ram in the base-plate, which is adapted for pushing the motte out of the flasks. This ram is operated by the treadle, which the man is depressing in Fig. 8.

In order that the motte may be pushed out in this way, it is clear that the upper flask must be held down. This is done by means of the catches locking it to the lower flask, which can be seen in all the figures. For holding the upper flask up, while the pattern-plate is being withdrawn, there are catches mounted on the upper cross-bar similar to those in the other machine. The remaining feature of the machine will be seen from an inspection of Figs. 5 to 8, the various stages in the operation which these figures illustrate being stated below them.

This latter machine was shown at the Foundry Trades' Exhibition at the Agricultural Hall by the Universal System of Machine-Moulding and Machinery Company, Limited, of 97 Queen Queen Victoria Street, E.C.

MARITIME NAIL CO.

A Fort William report says that the Maritime Nail Co., Ltd., of St. John, N.B., will commence the construction of its new plant at Fort William within a short time. Plans for the buildings are being prepared by a Boston firm. The president and general manager, Mr. L. E. Elkins, is expected back from Great Britain shortly.

◆

PAINT ON CAR EXTERIORS.

AT a recent meeting of shop superintendents in the United States, a novel point was brought up in connection with the unequal service of paint on opposite sides of car exteriors. It appears that a certain electric railway observed that the paint on one side of its cars was deteriorating much faster than the paint on the other side. This seemed inexplicable until it was suggested that as the cars were operated east and west without looping, the difference might be due to the fact that one side of the car was always exposed to the south and the other to the north. Arrangements were thereupon made to overcome this inequality in future by turning the cars occasionally.

LA FRANCE GASOLINE-HYDRAULIC TRUCK.

THE accompanying illustration shows a La France gasoline-hydraulic truck equipped with a two-wheel trailer hauling a 15 ton load of lumber in New York City. The day previous to this photograph being taken, the truck was equipped with the same trailer and with a platform, on which occasion no difficulty was experienced in carrying an 18-ton load of cement up a ten per cent. grade from the Hudson River to 79th Street, and in starting and stopping on the hill.

The Hydraulic Truck Sales Co., 1777 Broadway, New York, are sole distributors of the La France Truck.

LA FRANCE GASOLINE HYDRAULIC TRUCK WITH TRAILER CARRYING A 15-TON LOAD OF LUMBER.

Semi-Steel, the Product of Mixtures of Pig Iron and Steel

By M. Riddell

The accompanying article is an abstract from a paper read last month at the British Foundrymen's Convention, and will be found to deal fully with the production of semi-steel as presently practiced by the foundry trade generally.

FOUNDRYMEN have for long been impressed with the limitations of cast iron caused by the nature and quantity of the various elements which are inevitably associated in that product. This impression becomes accentuated by the knowledge that steel, which exhibits such superior mechanical qualities, is really a purified or refined cast iron. Various suggestions for improving the qualities of the metal by introducing other ingredients into its constitution have, from time to time, been proposed.

The method in which we are particularly interested at present is that of casting from mixtures of pig-iron and steel in varying proportions, the product being known by the somewhat euphonious title of "Semi-steel." The choice of name is rather unfortunate, because the casting produced possessses none of the special virtues which we associate with steel. It lacks ductility and can be neither forged nor welded. The utmost that can be claimed for the mixture is that it is a superior form of cast iron.

Semi-Steel Idea Not New.

The notion that castings could be improved in their mechanical properties by mixing wrought iron, which may be considered to be a very mild steel, or steel itself with pig-iron is by no means a new one. So far back as 1846 we find in the records of the Patent Office that a Mr. Sterling took out several patents for a method of toughening cast iron by melting wrought scrap and pig-iron together. He claimed that with 10 per cent. wrought scrap he got an increase of 10 per cent. in the strength of the casting; with 20 per cent, the increased strength was 30 per cent.; and with 30 per cent.; the improvement in the strength was 60 per cent. With regard to practical working of the process, he makes the significant statement that the improvement depended very largely on the nature of the pig-iron, and that some brands proved more suitable than others.

The difficulty of fixing on the suitable brands of iron, along with the inevitable difficulty of melting and casting sound castings from such mixtures, are doubtless responsible for the method not having been commercially pursued. Sterling's idea was that both metals would melt, and come down together in the cupola, thereby producing a homogeneous result.

In the United States the increasing shortage in the supplies of cold blast irons caused the ironfounders there, and especially those who were interested in the manufacture of rolling-mill rolls, pinions, car wheels and such like, to direct their attention to the finding of a substitute. It is also common practice in a great many machinery and jobbing shops, while several of the largest foundries adopt the method entirely for all their castings.

Difficulty at First.

At first much difficulty was experienced in getting homogeneous metal on account of the steel not mixing or entering evenly into combination with the iron. To overcome this, various expedients were adopted, such as Sterling's method of casting pig-iron round the steel, and also that of melting pig-iron and steel scrap together and casting into pigs to be remelted for the final casting, as is sometimes done with ordinary pig-iron mixtures. In American foundries, chemical analysis plays an important part in the regulation of cupola mixtures, and there is no doubt that a large part of their success with semi-steel is due to this fact.

All the metalloids which are found in pig-iron are, in the case of steel, regarded as impurities. As is well-known, the process of steel-making consists in first practically eliminating these impurities, and thereafter adding predetermined quantities of such as are necessary to give the metal the character desired. When dealing with cast iron, we must take the impurities as we find them, and endeavor by suitable mixing to keep them within bounds for the work in hand.

Carbon is the most important of all the metalloids, as the quality and usefulness of the metal for any purpose is primarily determined by the quantity as well as by the form of the carbon present. The proper regulation and control of this element is the most serious problem the semi-steel melter has to solve.

Melting Difficulties.

As is well-known, pure iron is fusible only at very high temperatures. One effect of adding carbon to pure iron is to lower the temperature at which the metal begins to melt. The more carbon that an iron contains, the more readily is it melted. Shortly expressed, it may be said that the melting point is a function of the percentage of carbon present. In the case of cast iron the other constituents, and especially the phosphorous, assist in lowering the point at which melting begins.

Difficult at First.

Most of the steel scrap which is used in semi-steel mixtures consists of low-carbon metal, such as steel rails or boiler plate. When it is considered that the very high temperatures necessary to melt this material are not usually attained in cupola practice, it is easy to see that, at the very outset, the process is confronted with a difficulty. Notwithstanding its infusibility at cupola temperatures, steel scrap is reduced to the molten condition in the cupola, and it is the more necessary that the semi-steel melter should have some theory regarding the influence at work to render steel fusible, if he is to run his practice on scientific lines.

It has been suggested to the writer as a possible solution of the melting difficulty, that the iron and steel act with respect to each other as do the constituents of an alloy, and that the melting temperature is reduced in virtue of the alloy principle when the constituents are brought into contact. Cast iron and steel are only modifications of the same alloy, and they do not form a eutectic. Further, anyone who has seen how the melted pig-iron trickles down through the coke in more or less restricted and defined channels will appreciate that it would take a very large quantity of pig-iron to effectively reduce a comparatively small quantity of steel.

The Carbon Feature.

Under the conditions which prevail in the blast furnace, iron can absorb or dissolve fully 4.00 per cent. of carbon. The actual amount which will be dissolved is simply a question of time and temperature. It is for this reason that cold-blast irons contain less carbon than hot-blast pig-irons. Steel is a cast iron from which this absorbed carbon has been largely removed, and, when we introduce it into the cupola among carburising influences, it will set about to recover from its surroundings some of the carbon of which it has been deprived. The coke, the carbon monoxide gas, and even the pig-iron itself will be called upon to furnish their share of carbon. It is not necessary for the iron to be in the molten condition before it can absorb the carbon. The action begins soon after the metal is at a good red heat. It is this principle which is the basis of the cementation process of steel-making.

What happens in the cupola is, that the steel absorbs carbon until it contains the percentage necessary for the temperature of the cupola at the time. When this point is reached, the steel may be said to be saturated with carbon, and the slightest increase in either the carbon or the temperature will make it liquid. For example, if the temperature of the cupola is 1,300 degrees C., and the steel scrap consists of boiler plate with 0.16 per cent. carbon, this will remain solid and continue to absorb carbon until there is 1 per cent. present, and whatever part of it contains that amount of carbon becomes fusible at that temperature. With a higher temperature, less carbon will be required and with a lower temperature more carbon will be taken up before the metal is fusible. It is questionable if a temperature of even 1,300 deg. C. is reached in general cupola practice.

In pig or cast iron the phosphide eutectic is the last to solidify, and this it does at the comparatively low temperature of about 950 degrees C. While some of the phosphide gets entangled among the crystals which have formed out earlier, it becomes more segregated towards the centre of the pig or casting. When the pig iron is put into the cupola the centre is the first to liquefy, and by the time the outer portions have reached the melting point of cast iron the whole mass is ready to collapse.

By the time the mixture has reached the temperature of the melting zone it may be said that the pig iron has finished melting, whereas the steel scrap is only beginning to dissolve. The outside of the latter is the only part which is meltable, and therefore the more outside with the less inside the steel has, the more nearly will its speed of melting approximate that of the pig iron.

Adding Steel Scrap to the Ladle.

When steel scrap is added in the ladle, the carbon which is necessary for fusion at the temperature of molten iron will be taken from the surrounding cast iron. To demonstrate that this is what actually takes place, and at the same time to gain some insight into the melting phenomena of semi-steel mixtures, it is only necessary to examine a piece of soft iron or steel rod which has been used in the cupola spout. If the rod be broken at a part where it has been in contact with the running iron, the fracture will show the soft grey iron centre surrounded by a narrow band of close-grained high-carbon steel. The rod appears as if it had been chilled or case-hardened, and a trial with a file will confirm this impression. The carbon in this case could come only from the cast iron, and any portion of the rod which had been dissolved off must have contained about 2.00 per cent. of carbon, the amount necessary, according to the diagram, at the temperature of molten cast iron.

Benefits From Steel in the Cupola.

Among the benefits expected from the use of steel in the cupola is that there will be a corresponding reduction in the percentage of total carbon in the casting. Thus, in a 20 per cent. semi-steel mixture, using a 3.50 per cent. total carbon pig iron and a 0.16 steel scrap, there should be, apart from any reactions in the cupola, only 2.83 per cent. of carbon in casting. The results of a number of analyses with various percentage cupola mixtures show that the steel absorbs sufficient carbon to bring its own carbon content up to somewhere about 2.00 per cent. It may be slightly less or more. Instead of 2.83 per cent. carbon, it will be found that the casting contains nearly 3.20 per cent.

There is, therefore, no advantage to be gained by the use of low-carbon steel scrap in the cupola, but rather the reverse. No matter what percentage the steel contains originally, it must attain the percentage to bring it into equilibrium with the temperature of the cupola before it will melt at all. The less carbon it has to begin with, the longer will it take to reach the saturation point. The most important point for the semi-steel melter to consider is the size and section of the scrap. The cupola will look after the carbon. Hot and fast melting with the metal cleared from the cupola as quickly as possible to remove it from the coke is, of course, desirable.

The Silicon Feature.

Another element which calls for consideration in semi-steel mixtures is the silicon. This substance derives its importance from the influence it exercises over the form of the carbon in cast iron. In steels, all the carbon is in the combined form, and silicon is not desired in that metal. If found at all, it is only in traces. In passing through the cupola, there is a slight loss in the silicon of the pig iron. Assuming, for the sake of simplicity, that this loss is compensated for by the silicon in the steel, a mixture with 20 per cent. scrap as before, and a 2.00 silicon pig will give a percentage of 1.60 silicon in the casting. With practically no alteration in the carbon, this reduction in the amount of the silicon will result in a larger percentage of the carbon being in the combined form, and thus tend to make the casting hard and brittle.

Close attention requires to be paid to this reduction, and provision made for the silicon in the casting being brought up to an amount compatible with the work in hand. It is recommended for light castings of a light section, especially if they are to be machined, that the silicon should be nearly 2 per cent. Heavier castings will do with less.

The other constituents of cast iron, with the exception of manganese, demand only a passing reference. The behaviour and influence of sulphur is the same in semi-steel mixtures as in ordinary mixtures of cast iron. There is this advantage from a semi-steel mixture that the percentage of these impurities is thereby reduced.

Hard Spots.

White hard spots and blowholes are not uncommon in semi-steel castings, their presence being due not so much to any fault of the process itself, as to a failure to understand the conditions which govern the process.

The explanation which is generally given to account for the presence of hard spots in semi-steel castings is that these are caused by imperfectly melted steel, implying that the temperature in the cupola was not high enough to melt it thoroughly. In a paper presented at the Conference two years ago, some interesting observations were made on this subject. The writer of the paper stated, inter alia, that when steel scrap, such as punchings, was used, there was a chance of some of the punchings getting to the bottom of the cupola through the coke. Once they got so far, there was not heat enough to melt them away. These incompletely melted punchings, he believed, were the cause of hard spots. Considering the composition of such scrap, it would appear more natural, however, to expect that the spots would be soft instead of being hard, if imperfect melting was the only explanation. As has already been pointed out, it is possible to melt or dissolve steel scrap in the ladle where the temperature is even lower than in the cupola.

Imperfect Mixing.

The true explanation is to be found, not in imperfect melting, but in imperfect mixing after the metal has been melted. It is merely a question of getting the carbon and silicon evenly distributed throughout the mass. A simple illustration showing how a hard spot can be manufactured will probably make this quite clear. We have only to imagine a small piece of a soft iron or steel rod placed in a ladle of good hot iron, and allowed to lie there without being disturbed. As soon as the temperature of the piece gets high enough, it will begin to absorb carbon from the iron. When at the temperature of the liquid cast iron, it will continue to absorb carbon until it contains nearly 2 per cent. It will take up no silicon at all, and consequently, if the metal is allowed to solidify without being disturbed, a spot will be found in the casting with a high percentage of combined carbon. The obvious remedy was to have stirred the metal until the melted spot had been completely diffused in the surrounding iron.

Melting Rules.

The principal rules to be observed in melting semi-steel mixtures may be summarized as follows:—

Work the cupola hot.

Select the scrap according to its section and avoid massive pieces.

Use clean scrap.

Reckon that the steel in the cupola will contain from 1.70 to 2.00 per cent. carbon when melted, and base calculations on these figures.

Estimate and provide for the silicon in the casting according to this basis, keeping in view the section of the casting as in ordinary iron mixtures.

Above all, take care that the metals are thoroughly mixed, and with this end in view, have the metal hot from the cupola.

Experience shows that the shrinkage and contraction in semi-steel castings are greater than in cast iron, the amounts varying with the proportions used. With the lower percentages, the variation is only slight, but it becomes more pronounced as the proportion of steel is increased, and should be provided for by a corresponding increase in the sizes of the heads and risers.

Owing to the reduction of phosphorus, etc., the range of fluidity of semi-steel is shorter than that of cast iron and the metal sets quicker. To meet this, it will be necessary to pour hot, involving attention to the refractoriness of the facing sand, and to provide ample gates and runners so that the metal may get to all parts of the mould in the shortest time possible.

Castings made from semi-steel mixtures show a close-grained structure when examined under the microscope. The graphite is seen to be in small curly flakes, while the pearlite persists in the sorbitic form. It is due to this influence on the structure that the addition of steel scrap does undoubtedly strengthen a weak and open-grained cast-iron.

To demonstrate the effect of adding steel scrap to cast iron a number of test bars were prepared, firstly, from the pig-iron only, and then from a mixture of the same pig-iron with steel scrap.

	Si.	C.C.	Tensile tons.	Transverse 2 in. by 1 in. bars.
West Coast Hematite	2.8	....	9.80	2,700
West Coast Hematite with 25% Steel Scrap	2.2	0.56	12.50	3,360
General Jobbing Mixture	1.87	0.50	11.75	3,425
General Jobbing Mixture with 25% Steel Scrap	1.5	0.70	14.70	4,400
Hard Mixture with 15% Steel Scrap	1.36	0.72	17.15	3,360

CUTTING SPEEDS.

By Francis W. Shaw.

In discussing the question of cutting speeds, one often hears the assertion that a certain steel is capable of a certain—generally high surface velocity, and by many it is presumed that this speed can be maintained on a given material regardless of any other factor.

Variable Speed Feature.

If on a certain diameter, the speeds provided do not allow of the obtainment of this particular speed, then a certain loss in output must inevitably occur; hence the need for a speed drive infinitely variable between the limits of the capacity of the machine, or a drive having so many speed changes that it may closely approximate the infinitely variable type. As support for this kind of assertion, certain cyphers are presented in an endeavor to show the loss accruing from the absence of this "correct" speed.

Says one:—"Assume, that on a certain job, 50 ft. per minute is the best possible surface speed, and the nearest speeds given by the machine are 40 ft. and 60 ft. Then, if 60 ft. be too high, we should be compelled to use the lower speed, 40 ft., with a consequent loss in output of 20 per cent. To this must be added the establishment charges and so on."

This argument, if it were just, would be sufficient to warrant the closing of the steps between speeds to a very close figure, for even 2½ per cent. is well worth saving, and will pay for a considerable increase in outlay in the construction of the machine. Not only so, but a similar argument would apply equally well to the feed motion, for a similar loss would occur by reason of the absence of a feed rate between 1-40 in. per turn and 1-60 in. per turn. Yet, how frequently do makers of lathes who consider 16 or 18 speeds necessary in a headstock apply the argument to the feed motion. One, indeed, frequently notes such combinations as 16 speeds having a percentage of variation of 20 per cent. between adjacent speeds, and 8 feeds having a percentage of variation of 50 per cent. This is, of course, illogical, if the argument respecting multiplicity of speeds is just.

Establishment Charges.

As regards establishment charges, decreased output during cutting time will not affect them greatly, for at least one-third, oftentimes half of the total time on a job is expended in setting the work and tools, and in other incidentals. The writer has had the opportunity of going rather thoroughly into this question at various times. In one shop, in which were located 45 lathes, each in charge of a turner, there were never more than 9 running at one time.. In another shop, this time, a modern capstan and turret lathe department, the idle machines averaged about 60 per cent., although nominally all were in use. The fact that four or six automatic turning machines is sufficient to keep a man busy all the time shows that a waste of some 15 to 25 per cent. is certain.

Again, it is unlikely that all the speeds used on a particular job would be so far removed from the "best" speed as 20 per cent; but the argument is not good, as can be readily shown. To every practical turner, it is a well-known fact that speeds and feeds are inseparable; that if he increases the feed he must decrease the speed, and vice-versa, if the feed be decreased, the speed may be increased.

Controlling Factors.

According to Nicolson and Smith, the controlling factors are, when aiming at maximum output, the quality of the steel being cut, the quality of the tool, the time it is desired that the tool shall remain in good order, and the area of the cut. Given all these, then the speed can be readily determined. A certain formula is given which shows that, within small limits, the cutting speed is almost inversely proportional to the area of cut. Hence, if the speed be decreased within reasonable limits, it is only necessary to increase the feed or depth of cut, or both, to secure the same output. Thus, if the work is capable of being done at a cutting speed of 50 ft. per minute when the area of the cut is one-eighth of a square inch, then at 40 ft., the area of cut can be increased 25 per cent., or to five thirty-seconds of a square inch, giving the same output. On account of the reduction of cut area, coincident with the speed increase, the tool will last approximately as long as before.

If this is correct, and there seems to be no reason to doubt it, the experiment which preceded the dicta being extremely thorough, and supported by outside evidence, then the necessity of providing an infinite range of speeds becomes of much less moment; and still of less importance when one takes into consideration "standing" time, and the fact that maximum output is not always the aim, that quality of output may be of more consequence. The writer's own experience dictates that a speed ratio between adjacent speeds is ample for all practical purposes, particularly if a close range of feeds is provided.

Suggested Compromise.

For a small lathe, say, about 14 in. swing, the following is suggested as a good compromise for general work; eight speeds approximately in geometrical progression with a 50 per cent. rise, 30, 45, 67, 100, 150, 225, 340. This would give a cutting speed of 30 ft. per minute on work a foot in circumference, and on work about one inch in circumference. Eight feeds from 1-64 in. to ⅛ in. per turn (preferably also in geometrical progression) would enable almost corresponding outputs to be obtained at several different combinations of speed and feed.

If the machine were installed for work rather smaller or larger than was the intention of the designer, then it would be a simple matter to speed up or speed down by raising or lowering the whole range, that is, by running the countershaft or single pulley faster or slower. To accommodate temporary requirements of this nature, the change also would be temporary. A good plan, and one frequently followed, is to fix two pulleys on the lineshaft and keep a spare belt.—Page's Weekly.

MECHANICAL STOKING OF LOCOMOTIVES.

THE mechanical stoker has been experimentally applied to a considerable number of American locomotives, their huge dimensions rendering such assistance almost essential in view of the large fuel consumption entailed to keep them going; but so far the human fireman still holds his own.

There is, however, an alternative method which is finding considerable favor. This consists of a coal passer, a mechanical device placed in the coal space of a locomotive tender for the purpose of moving the coal forward from the back end of the coal pit, and keeping it within convenient reach of the fireman. The coal passer automatically mixes the slack, which has through vibration settled to the bottom at the back end of the coal pit, with the lump coal which remains on top, thereby supplying the fireman with a uniform grade of fuel during the entire trip.

The mechanical coal passer is of very simple construction, and includes a tilting hopper, with a supplementary hopper connected to the bottom of the coal pit by means of strong cast steel hinges. A rod is connected to the supplementary hopper, and operated by a steam cylinder whereby the hopper is raised to carry the coal forward, at the same time causing the large and small coal to be thoroughly mixed as it is deposited in a position handy for the fireman.

THE SERIES MOTOR.

THE series motor is employed in automobile work almost exclusively, its high starting torque constituting a practical advantage that so far has offset the defects of momentarily heavy copper losses, and consequently reduced efficiency during acceleration periods. Experiments have been made with compound-wound motors, and with regenerative making systems, but there seems little likelihood of such systms finding favor with the lighter types of vehicle, although for heavier work the possibilities are more hopeful.

NEW WELLAND CANAL CONTRACT.

THE contract for the first section of the new Welland Canal was let by the Government on July 18 to the Dominion Dredging Co. at three and a half million dollars, being the lowest tender. This is for section 1 of the new canal, beginning at Lake Ontario. It is the intention of the Government to let the contracts for the work section by section. The new canal is to be finished in five years, and will cost approximately fifty million dollars. Work on section 1 will be commenced at once by the successful tenderers. Keen competition was shown by the dredging firms of Canada in bidding for this contract, and the bid of the successful tenderers is under the original estimate. There were ten tenderers in all, which meant two million dollars in deposits with the Government.

Departmental engineers are concluding the work of checking up on sections 2 and 3. Section 3 is to be the big contract of the canal, and much heavier deposits will be required. The whole work will be under contract this year.

CASTINGS TO RESIST CORROSION.

SOME practical rules laid down by the American Foundrymen's Association for obtaining castings resistant to corrosion are as follows:—

(A)—Use white iron if possible—white irons are especially useful where any acidity is to be encountered.

(B)—If not practicable to use white iron castings, chill those surfaces which are to be in contact with corrosive conditions.

(C)—If grey iron must be used, get dense close-grained castings through the use of steel scrap or otherwise.

(D)—Avoid oxidised metal; use pig irons of good quality, together with good cupola practice. If possible, use deoxidising agents; for example, titanium or vanadium.

(E)—Keep the sulphur as low as possible.

LETHBRIDGE GOING IN FOR MORE INDUSTRIES.

FOLLOWING out the suggestion made by Joseph P. Tracey, Commissioner of Commerce and Manufacture, on his first trip to Lethbridge, the announcement has been made of the formation of a Company to be known as the Lethbridge Industrials, Limited, composed of local businessmen and others for the express purpose of creating a steppingstone which should result in the location here of small industries. The company will be capitalized at $25,000. W. C. Ives, president of the Board of Trade, is one of the prime movers of the new concern, which is patterned somewhat after the lines of a larger Company of business men in Saskatoon.

DOMINION STEEL CORPORATION.

IT IS reported from Sydney that the orders at present on the books of the Dominion Steel Corporation will take the entire output of the Steel Rail Department from now till the first of November. This is considered particularly satisfactory, inasmuch as the Steel Rail Department works night and day. It is expected that, within the next few weeks, orders will be closed which will result in it running to full capacity for the whole of the present year.

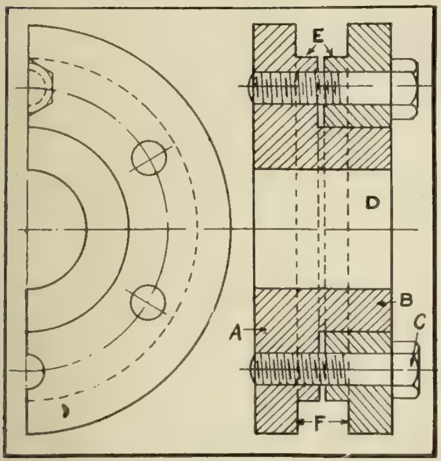
BUSHING FOR TURNING PIECES WITH LARGE BORE.

By E. W. Tate.

THE line cut illustrates a bushing used for turning the face of large pieces, such as ring gears, and may also be used for cutting the teeth on same.

The bushing is made in two parts—a male and female member (A) and (B). The diameters (E) should be turned to a good fit for the piece to be face turned or cut, the bore and sides of which have been previously finished while held in a chuck. Care should be taken that the bore of the bushing (D) be of correct diameter to accommodate some standard arbor of the gear cutter. It will also be noted that the distance (F) shall be at least one-sixteenth less than the face of the piece machined.



BUSHING FOR TURNING PIECES WITH LARGE BORE.

PREVENTING THEFT OF PERIODICALS.

By J. G. S.

MANY firms provide for their employees, reading rooms well stocked with current popular and technical magazines, books and catalogs. In these, employees spend their noon hour. At a certain factory in Philadelphia the reference books, magazines, etc., in the library represented quite a large sized investment, and although there was a rigid rule in force prohibiting taking the books and magazines away from the library room, a good many used to disappear each month. Simply stamping the firms name on them did not stop this, so it was suggested that all books, etc., in the library be stamped in large prominent letters as follows:—

STOLEN
From the Blank Manufacturing Company

Although the foregoing may seem a little startling, it worked very effectively, and put a complete stop to the practice, as no one cared to carry away a magazine with such marking on it. The plan has also been adopted by different clubs, etc., with satisfactory results.

BROACHING FIXTURE.

By H. R.

THE fixture here illustrated is for the broaching of the keyways in toothed wheels. By this method it is much quicker and more economical than the old slotting arrangement. The main body of the fixture is the casting (A), out of which is turned the spigot (L) for location on the broaching machine. The plug-holder (B) is of hardened steel, being let into the casting and held securely by the filister head screws (C). This holder is made so as to accommodate any desired diameter of plugs (D), so as to suit the different bores of the wheels to be operated upon. These plugs (D) also form a guide for the broaching tool (E).

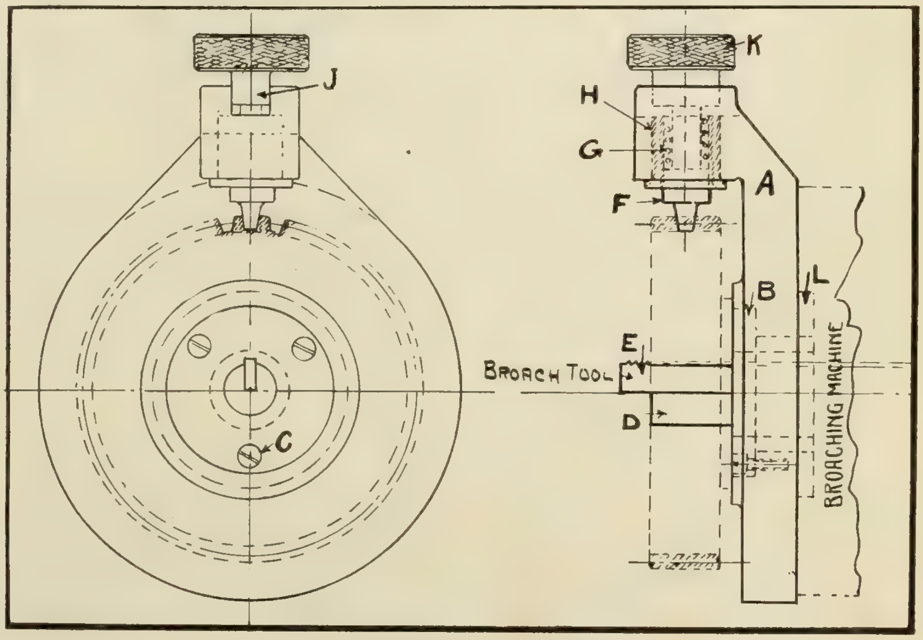
The wheel to be operated upon is located for its correct position by the plunger (F). This plunger is pressed into position by the spring (G), and slides in the hardened steel bush (H). The knurled knob (K), as will be clearly noted, slides into a squared off slot (J), so that by lifting the plunger and twisting same round this is held out of the way of the wheel while the next is being put in position. The illustration shows that the wheel is positioned by a space, but sometimes it is necessary to have the wheel located by the centre of a tooth; therefore, a plug is made to suit the form of a tooth.

BLANKING PUNCH AND DIE.

By A. L. M.

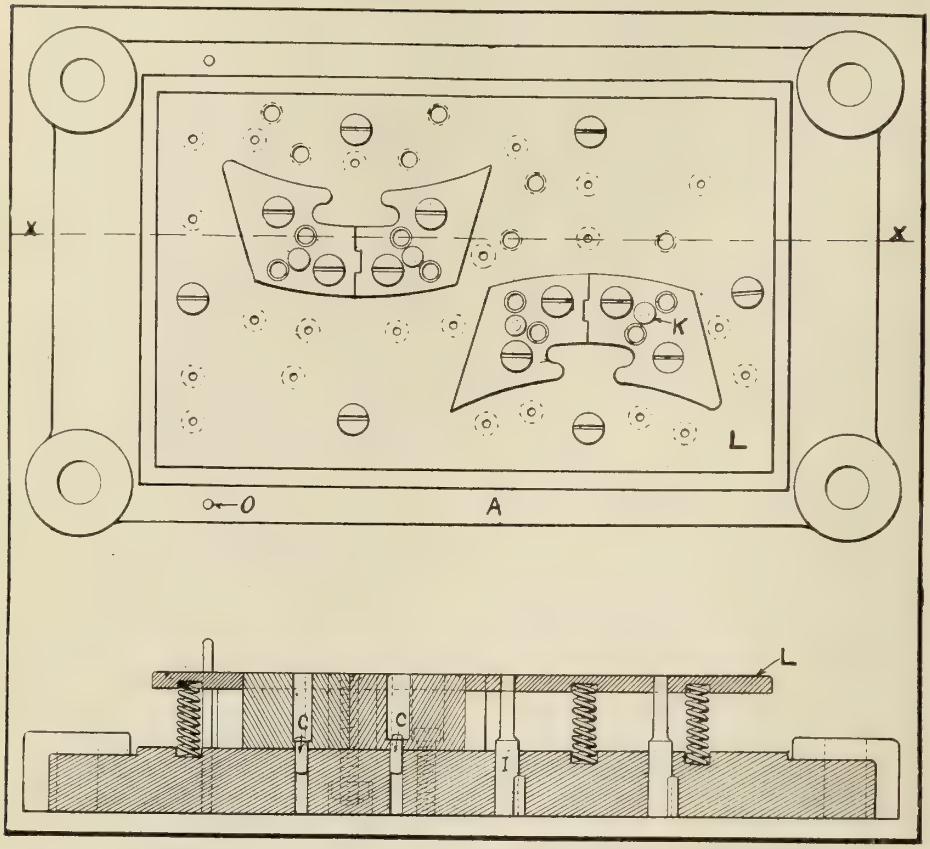
THIS double sectional blanking punch and die is not altogether original with me, but various improvements I have added from experience. It has proven satisfactory, and I am sure its value will be readily seen. These tools were designed, after some little study, in combination with others in use for the last year and a half, and, although we have not departed from the original to any extent, we have since added improved features to the different sets in service.

Differences of opinion have been discussed as to how these tools should be built up, and the first to be considered was what type of press was to be used. It was finally decided to use the in-



A BROACHING FIXTURE.

clined type, with the knock-out arrangements. The reason for this decision was that all the vertical presses were in use, and could not be spared for some time to come.



BLANKING PUNCH AND DIE— PUNCH PLAN AND SECTION X.X.

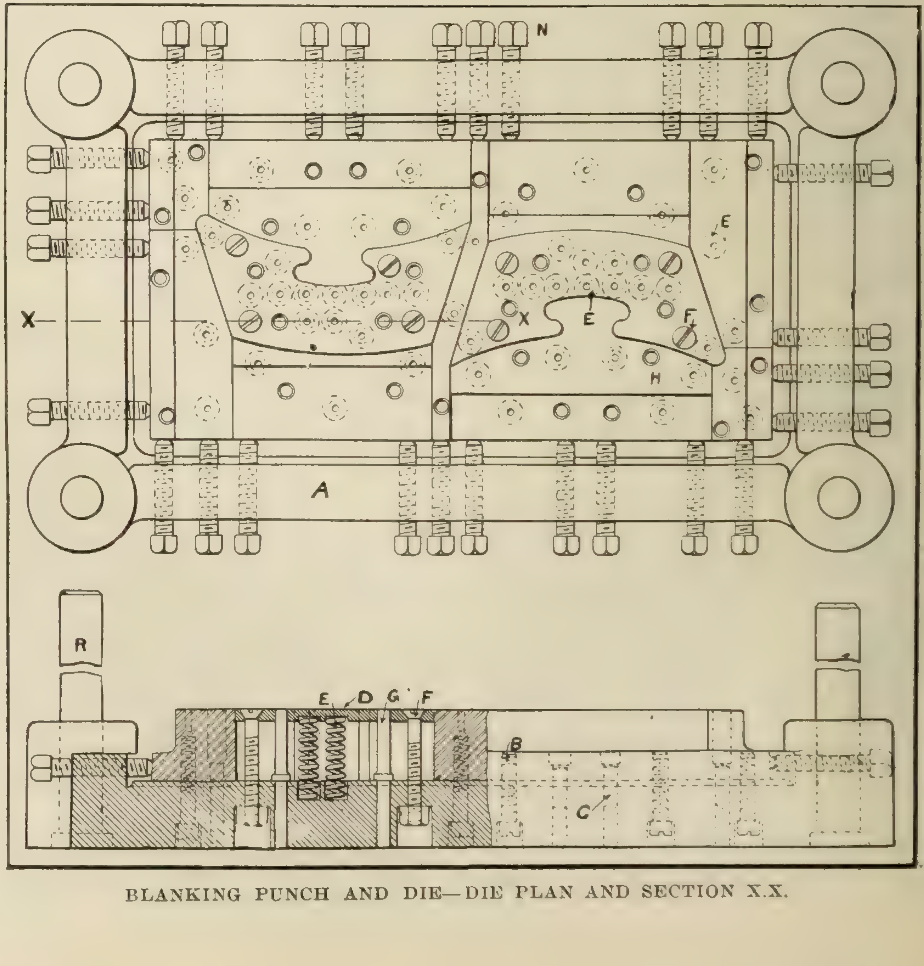
A vertical press could have been used and the blanking dropped through the die. In that case, the die must also be hardened, as there is considerable wear caused by the friction of the innumerable punchings required per day. As an enormous quantity was required every day for over six months, we came to the conclusion that an inclined press with knock-out punch and die arrangement would be the cheapest in the long run. This latter method causes the blanking to fall by gravity after being punched.

The construction and shape of this punch and die are such as to allow it to be machined all over and with the minimum of handwork and filing. It is a very easy matter to lay out a single or solid die, but when it comes to lay out a die for cutting two or more blanks at the same stroke, one finds it a harder proposition unless the design is of a superior quality to sustain an output of 30,000 laminated pale pieces of sheet copper, 0.012 inch in thickness, per day.

Should this double blanking have been made solid, and should small crack have appeared in the hardening it would have spoiled the entire die. In this sectional way all the cutting edges and sides can be ground to templet, and, with very little expense, replacement can be made at once, as duplicate parts of the punch and die were made in case of a breakdown. All the sectional parts are fitted in the cast iron holder (A) with two to four screws (B) and two dowel pins (C). Inside of the die is fitted knock-out plate (D), which has a 1/8 in. movement up and down. Underneath this knock-out plate are placed 12 spiral springs (E), which have a seat in the bottom of cast iron holder and also underneath the plate. The plate is held and adjusted to position with four flat head screws (F).

It is very essential to accurately locate the holes for the punches (G) and bushing (H), as they are fitted and located from the templet, and in alignment to one another, so that they will not stick during operation. The sectional parts of the punch were all machined square and to shape all over, allowing 100th of an inch for finish after being hardened. Those of the die were left soft.

In laying out the holes for the punches and bushings, where approximately marked, one of the holes was drilled and reamed in an adjustable jig vise. By clamping a parallel piece on one end to act as a stop for locating the following piece, the vise was then loosened, and the work removed and cleaned of all dirt, chips, oil, etc. By using different size blocks made for the purpose, the work was again replaced in the jig vise with size blocks between



BLANKING PUNCH AND DIE—DIE PLAN AND SECTION X.X.

the stationary jaw and the parallel stop, and the next hole drilled and reamed. This operation was repeated, a size block added each time to the required dimensions until all the holes were drilled and reamed. With this arrangement, it is possible to space the work far more accurately than it would by the "cut and try" method of using a pair of dividers for laying out the work.

This sectional punch and die was made in the tandem style in order to save as much of the metal as possible without danger of weakening it anywhere. The two cast iron holders (A) slide on four sub-press pins (R) in order to keep the punch and die in perfect alignment during the punching operation. These sub-press pins are made of tool steel hardened and ground to a perfect sliding fit. The head end is left one thousandth large for a drive fit.

The sections are all located permanently on to the holder (A) from the punch after that is hardened and completely finished with the sub-press pins in position. A line is drawn on the outside and around the punch on the die sections, and machined to the line. Each section is marked separately and finished complete, then placed on the die holder to be marked from the bottom for screws and dowel pins. By heating the section to a blue color before scratching the lines, they will then be very visible to work to, as you can see to cut the line in half with the aid of a magnifying glass. By using ordinary vitriol for coloring it is no matter how deep you scratch the line, for when you come down within a few thousandths the line is lost.

In front of the punch are located the piercing pins (I). These are a drive fit in the cast iron holder, and are held securely with a straight pin (J) on one side. On top of each sectional punch is driven in the pilot pins (K). These locate the metal properly when the punch descends.

Around on the outside of the section punches is closely fitted a 5-16 inch stripper plate (L). This is made of machinery steel and is held in position with twenty-four spiral springs, also adjusted to height with six flat head screws with nuts. All the spring holes in the stripper are transferred to the cast iron holder through the 1-16 inch hole in the centre of the spring seats, and after being counterbored for the seat of the spiral spring, they come in perfect alignment.

All die sections when possible are relieved so as to reduce the grinding on the face. When the die is assembled, it is held together with two set screws (N) on each section. In this way the die is as secure as if solid. The punch is located on the press table, and is held with four straps, one on each side. Two guide pins are placed on the left hand and on the end of the punch, and are so located that they are within 1-16th inch from the cutting edge. A punch and die made in this way is very durable, and from a practical standpoint, if any parts get broken, it is quite unnecessary to discard the entire die.

SPINDLE BORING TOOL HOLDER.

By A. L. Monrad.

A DRILL jig is very seldom bored in an engine lathe now, especially where a number of holes are required, and when these are at different angles, because of the importance of securing the proper location and accurate boring of holes for bushing studs, etc. A boring or universal milling machine is the most suitable tool for this purpose, it being used without the left hand support, common to boring bars.

In setting up the work, all measurements are taken from the table or from an angle iron permanently mounted on the rear part of the machine. Ordinary micrometer height-gauges are used in placing a jig in proper position on the table of a boring machine and parallel with the angle iron or the table, assuming, of course, that the angle iron is parallel or of the proper angle required with the spindle of the boring machine.

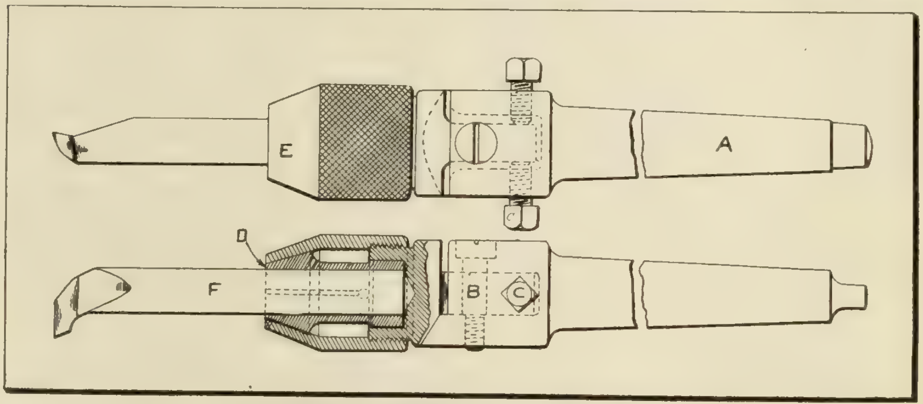
To bore a hole in proper location of the spindle, measure vertically from the table either to the spindle itself or to a short plug arbor made with a half centre on the end for measurement setting. Of course, the spindle must run absolutely true and without shake or play. After locating the spindle for the vertical dimensions, the horizontal measurements are taken from the angle iron to the plug arbor. With the spindle properly located for boring the particular hole, the same procedure is adopted for the next hole.

If two holes are in one line and at the opposite side of the jig, they should not be bored in one setting, as is commonly done, but rather the jig with the angle iron should be reversed on the table of the machine and relocated for the other side. This is recognized as the best practice, and overcomes the long boring bars and support on the opposite side, the latter of which is always more or less in the way. The operator can run his machine with his right hand and at the same time watch the work while cutting. With this method an adjustable boring tool holder is used, as illustrated.

The shank (A) fits the spindle of the machine, the same as an ordinary milling arbor, and the head enl of shank is slotted to a sliding fit for the swiveled chuck. This is held in the centre with a shoulder screw (B) and adjusted with the two set screws (C). The other end of this swivel is recessed a turning fit for the split chuck (D). The outside of the chuck is fitted with an ordinary knurled sleeve (E), which is threaded on the end, and with an ordinary grip tightens the boring tool securely.

Making the Boring Tool.

In making a boring tool (F), there is a kink worth knowing. Take the size steel bar required, and drill hole through a scrap of steel of same diameter. Round the corners a little in this hole, and heat the steel in a fireplace to almost white color. Take the steel out and place the boring tool end in the hot hole to the required length to be bent. Hold it there until the steel becomes blue. With the same setting, bend the end over to the right angle. By this method you have a straight boring tool after being filed on the end to proper shape.



SPINDLE BORING TOOL HOLDER.

Electricity has been treating steam with the haughty air of a superior, but is to be compelled again to associate on equal terms with its despised rival. The steam reserve has come to stay.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

CINCINNATI ACME UNIVERSAL TURRET LATHE.

UNIVERSAL turret lathes are especially adapted for general jobbing and repair work, and where only a small number of pieces are to be made. Their value is more appreciated where a small number of pieces are to be tapped or threaded, which would not justify the cost of taps or dies. For machining a large quantity of parts, the regular turret lathe will be more serviceable.

These machines are designed throughout for the use of high speed steel; all bearings are accurately ground and hand scraped, and the operating levers are placed within easy reach of operator.

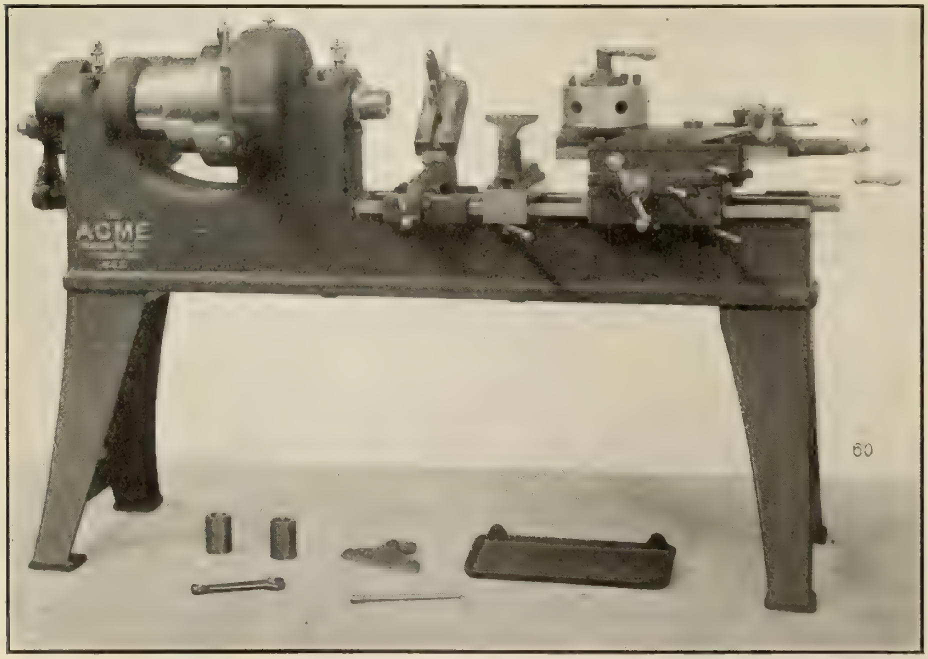
The head is cast solid with the bed, insuring greatest rigidity, and is provided with friction back gears, giving two speeds for each cone step, for turning and threading, or turning different diameters on the same piece without stopping the machine. All gears are entirely enclosed.

The spindle is made of high carbon hammered crucible steel, bored from the solid, accurately ground and mounted in renewable bearings of genuine babbitt.

The turret is round in form, and provided with six tool holes fitted with set screws. It is arranged so that stock up to full diameter of hole can pass through turret, allowing short, stiff tools to be used in turning long work. It is indexed automatically by the backward movement of the turret slide. The turret locking bolt is placed at front end of slide and works in hardened and ground taper bushings, let into the solid turret as near outer edge as practicable.

The turret slide is provided with swivel and set-over adjustments. Both lever and screw feed are furnished for the longitudinal movement of the slide which is graduated for swiveling, and provided with an adjustable stop. The set-over movement to turret is obtained by means of a ball crank handle and screw with large micrometer dial to insure exact diameters, and may be used in conjunction with the adjustable stop at rear of cross slide. The stop for determining the centre position of the turret can be shifted, so the turret can pass beyond centre in either direction. Taper gibs on both sides of slide provide means for taking up side wear. The saddle rests on an adjustable taper base, insuring perfect alignment between holes in turret and spindle. A binder handle on the front of saddle affords a quick and positive clamping of the saddle to the bed, and is not in the way of the operator.

The chasing attachment is arranged for chasing straight or taper right and left hand threads with the same leader and follower. The taper attachment is adjustable and graduated.



FRONT VIEW, CINCINNATI ACME 18 IN. FRICTION GEARED HEAD UNIVERSAL TURRET LATHE WITH CHASING ATTACHMENT AND HAND RESTS.

Three leaders and one three prong follower for cutting 11½, 14, and 18 threads, a hand rest saddle with two hand rests of different lengths, and a double friction countershaft with ring oiling boxes form part of the equipment of each machine. The lathes are also adapted for motor driving.

The Acme Machine Tool Co., Cincinnati, Ohio, are builders of the Cincinnati-Acme Universal Turret Lathe.

◆

OBJECTIONS TO HOLIDAY EXAMINATIONS OF BOILERS.

IT is a common practice, says "Vulcan," for steam users to have the thorough examination of their boilers carried out at general public holidays. In many cases it is impossible, under existing conditions, for this practice to be avoided, however undesirable it may be, but, in large numbers of instances, other arrangements could equally well be made, and a boiler be prepared for thorough examination at some time between general holidays.

Firms very often have sufficient plant to allow for at least one boiler to be laid off at any time for cleaning and examination, but, even when this is the case, many people seem to think it necessary to have their boilers examined at a holiday time, without any regard to other people who are not so fortunately situated as themselves, and who have no alternative. Prudent firms provide themselves with spare boilers for the express purpose of having time to properly conduct the periodical cleaning, and of having the annual inspections carried out at a period when there is no reason for hurry, and when repairs, should they be necessary, may be effected without dislocation of their ordinary work. Such prudence is wiser and more far-reaching than appears at first sight.

Hurried Cleaning.

A boiler cleaned in a hurry is often not cleaned at all, and experienced inspectors are well aware that boilers habitually examined during public holidays are noted for the amount of deposit with which they are coated on the water side. Such an accumulation of scale makes satisfactory examination very difficult, if not impossible, since the condition of the boiler can only be judged by the appearance of such portions of the plates as happen to be visible, coupled with the inspector's knowledge of the general conditions under which it works. It is well nigh impossible in such cases to give an unqualified report.

The coal bills for which badly cleaned boilers are responsible often seem to be forgotten; at any rate, little or no effort is made to reduce them, though the saving of fuel in many cases would in a few years pay for the cost of an additional boiler. Boilers stopped only at general holidays likewise suffer from indifferent cleaning of the external flues, and here again there is often an economical loss through impeded draught due to the flues being more or less choked with soot.

Where as a precautionary measure, or as a matter of necessity, the removal of brickwork from the seatings or over the top of a boiler is desirable, it frequently happens that in the hurry at a holiday period such important and often necessary preparation is altogether ignored, or very inefficiently done· This hurry over preparation, or rather the want of it, is often due, not only to the shortness of time available at a holiday, but to eagerness of workpeople to get away, and it is a common experience of inspectors when making examinations at holidays to find no person present on behalf of the firm. In such cases, if the preparation is incomplete, which it generally is, no one is to be found to render it more perfect, and should any repair be required, there is no official to whom its scope can be explained. It too often happens that no preparation is made for the convenience of the inspector; no tools of any kind are provided, in the shape of hammer or chisel, etc., often even the necessary lamp or candle for lighting purposes is missing, while his personal comfort is altogether ignored.

To sum up the whole matter, the examination of boilers at general holidays is never so satisfactory as at other times. Owners of boilers do not get full justice from their cleaners, and for many economical reasons such inspections should, so far as possible, be avoided. From the point of view of the inspectors, the objections are just as strong. A desire to oblige as many clients as possible makes them extremely busy at such periods; lack of preparation makes the boilers more difficult to examine, and this, in turn, introduces an element of doubt in the results obtained, while the personal discomfort and disadvantages under which they have to perform their duties tend to accentuate matters.

* * *

C. Ivan Murray, Toronto, has accepted a position as metallurgical engineer with the Pittsburgh Electric Furnace Co., Pittsburgh.

THE PRODUCTION OF MALLEABLE CASTINGS.

By Dr. Richard Moldenke.

THE first portion of this article appeared in our July 17, issue, and formed, as was omitted to be noted then, the subject of an address before the Connecticut Valley Section of the American Chemical Society, Hartford, Conn.

Next we come to the cupola. The cupola casting is used principally for such purposes as pipe-fittings, agricultural work, and those things that require only a little better strength than the gray casting of the same kind, but more malleability. Cupola malleable is a little cheaper than the air furnace or open hearth product. In all malleable melting processes, inasmuch as the iron is very low in silicon and consequently sets very quickly, it loses its life very easily; and especially if it has been oxidized at all, it must be gotten ino the mold fast. Consequently, a gray iron molder must be shown how to pour malleable; a little twist of the wrist throws the iron into the mold; otherwise it may be short poured. In cupola melting, there is always a very low coke ratio. Melting is done in a very high bed; perhaps higher than it ought to be, but it is necessary to get the iron very hot, and as free from oxidization as possible.

The Bessemer process is used in Europe only. They blow their heats to where the silicon is down to the right point, stop the heat, dioxidize and pour. What the castings look like I cannot say, but with their long anneal, in which the metal is decarbonized, they should make serviceable castings.

The air furnace is the furnace principally used for the production of "malleable" in the United States because it lends itself particularly well to this class of castings. The malleable air furnaces are constructed differently than are the air furnaces for gray iron work. For gray iron, they have large cross sections, and are comparatively short. For malleable, very long furnaces are used, a long flame being desired to get the best result. The heat to melt, whether in the air furnace or the open hearth, does not come from the direct action of the flame so much as it does from the radiation of the interior brickwork. The idea in the air furnace and in the open-hearth furnace is to get the brick work lining so hot that the radiation downward upon the charge does the actual melting, and does it fast, so that no matter how much firing you do, if you do not fire to get your brickwork to such intense heat that the radiation melts the charge properly, you get unsatisfactory results.

Ask the malleable iron man what his ratio of coal to iron melted is; if he melts about two to three pounds of iron per pound of coal, he thinks he is doing well. Sometimes, I have seen a pound of coal used for melting every pound of iron, whereas it ought to be about four pounds of iron to the pound of coal when you run three heats in one day and average them all up. The first heat with the colder furnace is a little harder on the coal supply than the others.

I have observed the operation of many malleable plants. The first thing in going over the air furnace equipment is to see how they are kept. Not unusually you will find that you can look through the brickwork into the interior, there being plenty of spaces where cold air is drawn in. If you figure that the radiation of the lining does the work you can see how important it is that every square inch of the interior of the furnace should do its work.

The Firing Feature.

Take the firing. I have seen men throw the coal all over the bed of fire, and then take the slice bar and poke it up, whereas the right way to do is to pile the coal at the door, shut the latter, allow this coal to coke slightly, and then carefully push it over the entire area. Repeat the operation, and repeat periodically, instead of having the fireman use his shovel and bar all the time. He might just as well rest a little between the periods. The firing is something that must be watched very carefully in the air furnace installation. By so doing, a constant flow of gas is obtained from the coal.

While, in boiler practice, we figure on 100 per cent air admitted over the theoretical amount necessary to burn coal, if we get more than 25 per cent. excess free air in the malleable furnace, we begin to get trouble. If that 25 per cent in excess can be allowed uniformly, we then get that magnificent incandescence in the furnace which does the melting properly. If, on the other hand, the firing is done by fits and starts, the melting is unduly prolonged. One cannot be too particular in this respect because a very large proportion of the trouble in the malleable foundry is due to it.

Starting with say 0.95 silicon, in the mixture, if the heat is made sharp and short, this silicon content will be lowered to the 0.65 required for the ordinary run of castings nicely, and it will drop from 0.65 to 0.60 from the beginning to the end of tapping, whereas with a long, slow melting the iron may be 0.65 at the beginning of tapping and down to 0.55 at the end of the heat or a loss of twice the silicon. And when this occurs the iron has begun to oxidize. Another thing: Take a bath of iron in the air furnace which is deep near the bridge, and feathers out to nothing at the stack. If there is any one thing dangerous in the air furnace it is that thin, feather edge at the end; because there all the gases are swept over it, and the heat is transmitted into a very thin body of metal. Consequently, the temperature rises very fast at that spot; and the iron is liable to burn.

I have been preaching for many years that iron oxidizes in every melting process, even if ever so slightly. The worst case I ever came across contained only three-hundredths of one per cent. of oxygen. Such iron is unfit for use, for the simple reason that the freezing point has been raised; the iron sets too quick. It has lost its "life." In ninety-nine cases out of a hundred the troubles found in malleable castings practice may be located right here. If we study the papers on malleable we have seen recently we find a number of statements on the behavior of castings under certain conditions. These seem to me doubtful, as they may be based on metal that was oxidized in the making in the first place and showed characteristics afterwards which they would not have had they been made right. Air furnaces, which are in prevailing use for "malleable," are subject to this danger peculiarly, and hence must be watched so that heats are made in the shortest time possible.

I have made about 225,000 tons of malleable castings myself, and most of them in the Open Hearth furnace. It is to my mind the best melting process except the obsolete crucible and the electric, of which we know little now but will hear more of some day. The Open Hearth furnace melting process is only applicable where there is enough work to keep the furnace running steady. Look at the melting ratios: cupola, one to eight; air furnace, one to four under the best conditions (and the furnaces should always be kept in the best of condition); Open Hearth furnace, one to six is the melting ratio. The air in the Open Hearth furnace instead of going in cold has about 1,000 deg. F. heat. Whereas a good heat of 10 tons in the air furnace may take four hours, we can run the same heat in two and a half hours in the open hearth (from the end of the charging to the beginning of the tapping).

Unfortunately in malleable and in gray iron we are dealing with lower temperatures than in steel making, and hence the addition of ferro-manganese does not accomplish deoxidation. Hence, whereas in steel-making the unavoidable oxidation is thus corrected, in the case of malleable and gray iron this is not possible to a sufficiently satisfactory extent. Hence prevention is what must be looked after and not a cure after the damage through oxidation has been accomplished.

In making malleable you have the following condition. A great big bath of molten iron, hot on top, and down on the bottom not quite so hot. You take your test plugs, the fracture shows crystalline and white; it indicates that the composition is right. When you tap you draw the colder iron from the bottom first. The top of your charge comes down maybe an hour later. In the meantime the oxidizing reaction goes on; slag has been taken off; there is a direct contact with the gases, the metal is damaged. It should really be taken from the top first. The ideal method of getting iron out of an air furnace is to take it from the top. The tilting furnace gives this result. The tilting furnace costs about twice as much as the ordinary open hearth furnace. I therefore patented a three-spout arrangement for my furnaces, thus taking off six or seven tons from the top; then the next six or seven tons below; then break the breast out and get the rest of it from the bottom. This gives the ideal condition of the tilting furnace in sufficient measure.

In my open hearth practice I never skim, but let the slag cover the iron, thus protecting it somewhat against oxidation.

The composition of a malleable casting, so far as the silicon is concerned depends on its thickness entirely. In ordinary work the silicon should be about 0.65. For very heavy work I used to run my silicon down to 0.45. In the old days of charcoal iron my regular silicon was 0.35 (charcoal iron could be used as low in silicon as 0.10). With coke irons it is not wise to have pig iron with less than 0.75 silicon in stock. This brings us back to the question of oxidation again. In making cold blast charcoal iron you have a very small furnace to begin with; charcoal which eagerly absorbs oxygen as a fuel and hence the iron sponge formed melts with the least chance of oxidation. With the hot and more powerful blast, there is little further penetration of free oxygen; with the consequent greater oxidation of the iron sponge as it melts, and hence a weaker iron. With coke fuel there is a very serious entrance of free oxygen. Coke does not unite with the oxygen in burning as fast as in the case with the charcoal. The difference between charcoal and coke irons lies only in this oxidation question. It is the basis of all the trouble we have with our bad castings, because I know that wherever I have changed the method of melting to eliminate chances for oxidation troubles have fallen away.

The Sorting Room.

The next department to study is the sorting room. The castings from the foundry are first run through the hard tumbling room to clean them; then sorted to find the defective ones. If the foreman knows his business, by watching this department he can teach each man to overcome his difficulties and the losses will be cut down in consequence.

In annealing the idea is to get the castings up to the annealing heat quick, hold them at annealing heat for a given time—sixty hours is best—then to let them cool gradually. The quicker you can get the heat up in your ovens the more time you can save. You can keep them in the annealing ovens sixty, seventy, eighty, ninety hours; but sixty is found to be about right; and the specifications usually call for that as a minimum. The process is best carried out by packing the castings in oxide of iron. The material that we use is puddle scale, a silicate and oxide of iron. The material best and cheapest to use was the flakes from the pots. They are almost pure iron oxide. There are other methods used on occasion. In some of our railroad work, tie plates for instance, these castings can be put loose in the oven, practically making a retort of this and use no packing whatever. But the castings look rough when they came out but are good enough for the purpose.

Annealing.

As to temperature of the anneal—the old-fashioned way of looking at the cracks in the brick work to see the white line is very good if the eye of a man does not change. I prefer the LeChatelier pyrometer. The temperature should be taken at the coldest point of the coldest pot in the oven and not the temperature of the oven itself.

The temperature at the coldest point of the coldest pot should be 1350 deg., F.; it may go as low as 1250 or it may be as high as 1400. For cupola iron, the temperature must be about 200 degrees higher, because of the fact that the iron was melted in contact with the fuel, and has a higher sulphur content, which obstructs the annealing changes at lower temperatures.

There is much more that could be said on this subject. It is a life work to become familiar with all the peculiarities of this single line of the iron casting industry. Enough, however, has been given to show what an interesting field the production of the Malleable Casting is, and how much there is still to be learned in this direction.

EFFICIENCY AND EQUIPMENT.

AT the present day, perhaps more than ever before in the history of industry, the question of costs is a matter of vital importance. New methods for their accurate determination are being applied and by means of a series of careful assays and observations, a set standard of efficiency of production can be arrived at for each of the various factors that go to make up the cost of any commodity. Of these factors, by no means the least important are the indirect charges for maintenance of power equipment.

Mr. Harrington Emerson, one of the few authorities on the subject of efficiency, urging the importance of giving detailed attention to the question, says that "no one acquainted with the scandalous inefficiency of the average factory power plant, consuming from 5 to 7 pounds of coal per H.P. per hour will question the ability to lower costs 28 per cent., and no one acquainted with the leaks of air, steam and water, leaks of light and heat, frictional losses due to lack of alignment, too tight bolts, etc., will question the possibility of reducing the power consumption 30 to 33 per cent." The day is not yet in sight, however, when in every power plant where an engineer is employed, standards of efficiency can be set as definite as the dollar, franc, sovereign or mark. Even in large installations where the expense would be justified, there are as yet but few staff experts appointed for this work alone.

Although the value and importance of efficiency is not yet generally appreciated, the cry is in the air, and already, in even the most unlikely places, the question is being approached, awkwardly and blunderingly it is true, but in the right direction. It will be seen, therefore, that it is becoming increasingly important for those who are engaged in the supervision of our factories, for engineers, machinists and operators generally, to give to the question of efficiency more and more attention, because in the near future those only will fill the best positions who are able to compass a certain established minimum set standard of efficiency.

We make for the highest efficiency, if we assume, until the contrary is conclusively proved, that existing equipment utilized to the utmost advantage is sufficient for all requirements. This is not only common sense, but as a truth, is clearly emphasized in a multitude of ways by every reliable writer on the subject, yet it is an extraordinary outcome of the efficiency movement, a symptom showing conclusively that the real meaning of the word has not been realized that, in many instances, the result of re-organization is friction and complexity instead of smoothness and simplicity, and costly equipment is often added without any real justification of need.

To return to our subject, and confining our observations meantime to those manufacturing plants where power is transmitted by electricity, it may be said even of small installations, that there are almost invariably hundreds of remediable causes that militate against the attainment of a reasonably high standard of efficiency. We are, of course, aware that an installation may be very inefficient with respect to the factors that should determine the choice and type of motors to be used for any particular work, in many instances little or no consideration having been given to the question of torque and speed. Again, controlling devices are often far from perfect, and the methods in vogue for driving may leave room for much improvement in so far as the question of individual or group operation is concerned. Yet the considerations involved in a determination of the best and most efficient course to follow with respect to these questions are so varied in character, that general hints are of little practical use, and while, perhaps, the best advice to follow is that it is better to improve than to replace existing equipment, yet it must not be overlooked that there are often high losses in shafting, which may be eliminated by the substitution of individual motors direct coupled to the machines. On contemplating any such change, it is important to work out whether the saving to be effected will more than balance the interest on the capital expenditure.

SELECTED MARKET QUOTATIONS

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, July 21, 1913.—Despite the mid-summer dullness talked in most lines, the machine tool and kindred business is reported active and good. Some of the biggest contractors have made concessions, and there has been a loosening up, so that the trade in steel building material has been given an impetus that means a great deal to the tight money situation. The railways have been giving decent orders, and have done their best to relieve stringent markets by ordering sometime in advance. Considerable business is expected for viaducts and bridges in September. For bars, plates and shapes there has been considerable enquiry, in fact the specifications have gone forth in some cases, hence the confidence extant in the market. Small orders were in vogue for steel plates, and steel pipe has been in good demand, while wire products have continued weak, with sagging on black and galvanized sheets. There is anticipated a readjustment of wire prices, which will mean, perhaps a larger business in the fall.

Pig Iron and Copper.

A further downward tendency has taken place in the pig iron market, and all speculators have been compelled to acknowledge that this dip is the nearest approach to the limit in lowness that has been known this year. On the strength of this condition some large orders have been placed by pipe mills and steel plants, but the territory sales have been very small. The general waiting attitude in copper is rampant, and no one is in a mood to move. Why? Simply because the big producing and selling interests have combined to make a bid for higher prices during August and September, i.e., for shipment. Many premature efforts have been reported to advance the market.

Tin and Spelter.

There has been a steady movement in tin which has been gratifying to buyers and sellers, yet the quietness has been very marked. A slight decline has been in evidence, but this does not change the normal quotations which cover the week. Some concessions from the asking price made by dealers has caused some irregularity, but just to-day higher prices were being asked again. No vitality has been behind this movement, hence the quietness. Lead is quiet and easier, and refined spelter is dull and weaker. Old metal is also dull and uninteresting.

Toronto, July 22nd, 1913.—Practically no change is to be noted in the machinery and metal markets, the tendency being still to quietness. There is a fair demand for machine tools, but buyers appear to be holding off orders until the present money stringency passes. Favorable crop reports are expected to help matters to a large extent. Municipalities are curtailing their expenditures until more favorable opportunities arise for placing loans. Iron and steel merchants report a better outlook, although prices remain stationary. The American manufacturers of cast iron pipe fittings have withdrawn their price lists, and it is difficult to say which way the prices will go upon revision. It is probable, however, that they will be increased, as prices have of late been inclined to the low side. Trade in this line continues to be fair. No change has occurred in the local market in the prices of metals, some nice orders having been placed, although there is no heavy demand. Generally speaking, the conditions are quiet in this section also. Reports from London and New York indicate a like tendency.

◆

Lethbridge, Alta.—The city council have purchased the Lethbridge Woolen Co. Mill, and will convert it into a municipal power building. The building will be equipped with power sub-divided and leased to small industries.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Preston, Otn.—The Preston Chair Co. will build a factory here.

Montreal, Que.—The Walpole Rubber Co. may build a new factory here.

Peterborough, Ont.—The Can. General Electric Co. are making additions to their plant.

Hamilton, Ont.—The Dominion Steel Castings Co. will probably build an addition to their factory.

Montreal, Que.—The Robt. Mitchell Co. are proposing to build a large iron foundry adjoining their present plant.

Fort William, Ont.—The National Tube Co. have begun the construction of a plant to cost $400,000, and employing 150 men.

Montreal, Que.—The Board of Control have awarded the contract for the supply of two steam boilers to the Wickes Co., Saginaw, Mich.

St. Thomas, Ont.—It is reported that a United States syndicate propose to build a factory here for the manufacture of motor trucks.

Fort William, Ont.—The Great West Wire Fence Co. are under contract with the city to erect a plant for the manufacture of wire, to cost not less than $100,000, and employ 50 men.

St. John, N.B.—The Maritime Nail Co. have leased a mill in Germany, where they will roll their own rods. A contract for billets has been made with the German Steel Corporation.

Peterborough, Ont.—The de Laval Dairy Supply Co. are building a factory and installing equipment which will cost about $200,000. The company's separator factory will be moved from Montreal about September 1st.

Montreal, Que.—The Board of Control have accepted the tender of the Canadian Allis-Chalmers Company for the supply of an electric-driven pump of six million gallons capacity for the high level reservoir, for the sum of $6,356. The Canadian Boving Co. and Escher Wyss Co. also tendered.

Fort William, Ont.—Frank Ditchfield, General Manager of the Canadian Car & Foundry Co., states that the Fort William plant of the Canadian Car & Foundry Co. will be taxed to its capacity in supplying cars to the various Canadian railways just as soon as it is completed, which will probably be in the early fall.

Fort William, Ont.—M. A. Ryan, President of the National Boiler Works, Superior, Wis., has been in the city and has about completed arrangements for a site on which to locate a boiler manufacturing and structural steel industry. The plans and specifications of the proposed establishment have already been issued and no time is to be lost in putting up the buildings.

Electrical

St. Thomas, Ont.—The city council are considering the installation of a reserve steam-driven generating system.

Woodville, Ont.—A by-law has been carried to sanction the expenditure of $4,000 on a Hydro-Electric Power Service.

Calgary, Alta.—A by-law recently submitted to the people to empower the city to raise a loan to establish a municipal power building was defeated.

Edmonton, Alta.—The Sturgeon Power & Coal Co. have submitted a proposition to the city council in which they offer to supply the city with power generated at a point near the Sturgeon River where they have purchased 960 acres of coal lands.

PROBABLE EQUIPMENT REQUIREMENTS

The undernoted firms are now, or likely to be soon in the market for new equipment, etc. For fuller details, reference should be made to the news items:

Machine Tools.

Robt. Mitchell Co., Montreal, P.Q.
National Tube Co., Ft. William.
De Laval Dairy Supply Co., Peterboro.
Can. General Electric Co., Peterboro.
Great West Wire Fence Co., Fort William.

Bedford, P.Q.
Port Coquitlam, B.C.

Montreal, Quebec.—Duncan MacDonald, president and managing director of the Canadian Autobus Co., has left on a visit to London, Eng., to fix finally upon the type of motor bus for Montreal, and order supplies if the vehicles offered by the London General Omnibus Co. are found to be suitable for this city. That company have not only offered to supply Montreal with the requisite vehicles, delivery at the rate of 25 per week, but they have offered to take up a large block of shares in the Montreal concern, and one of the London directors, Mr. Duff, will have a seat on the Montreal board. If, therefore, the London type of bus is found suitable, Mr. McDonald will order deliveries immediately. 100 buses will probably be put into commission to begin with.

Wood-Working

Medicine Hat, Alta.—D. Rutherford and M. N. Merrian will establish a planing mill here.

Montreal, Que.—The Malone Moulding & Framing Co. will build a factory. Byers & Anglin, general contractors.

Dundas, Ont.—The Cockburn Lumber and Concrete Co. have practically completed equipping their new plant and will begin manufacturing cement blocks shortly.

Building Notes

Brandon, Man.—Fire has destroyed the C.N.R. elevator. The cause of the fire is unknown.

Port Arthur, Ont.—Good progress is being made in the construction of the new Government Elevator, which is to cost $1,250,000.

Edmonton, Alta.—Nicholson & Bain, of Winnipeg, will build a six-storey building to cost $70,000. The contract has been let and work will begin as soon as possible.

Toronto, Ont.—A permit has been issued by the City Architect to Warwick Bros. & Rutter, for the erection of a six-storey reinforced concrete warehouse at 407 King St. West. It will cost $56,000.

Moose Jaw, Sask.—Face Brick, Ltd., are establishing a new plant near here for the manufacture of pressed bricks. Five "Schope" brick machines will be installed and an output of 10,000 bricks per day is anticipated.

Toronto, Ont.—Plans are being prepared in Ottawa for the new examining warehouse on Front Street. The building will have eight storeys, and will be 500 feet long by 90 to 120 feet. It will cost about $1,500,000.

Toronto, Ont.—The Murray Printing Company has purchased a block of land a few feet north of Queen Street, on the west side of Spadina Avenue. The property was sold by John Earls for $42,000. A new building will be erected.

Brandon, Man.—Tenders have been called for the large fire-proof building to be erected in Brandon for Gordon, McKay & Co., Ltd., wholesale drygoods merchants of Toronto, as their headquarters in Western Canada, and the building will be rushed to completion as quickly as possible.

Municipal

London, Ont.—A by-law will be voted on shortly authorizing the council to expend a sum of $22,000 for a breakwater.

Port Coquitlam, B.C.—The town council have decided to purchase an auto fire truck and hose, the cost not to exceed $2,500.

Ayr, Ont.—Hydro-Electric by-laws were carried by large majorities here and in the neighboring villages of Princeton, Bright, Drumbo and Plattsville.

Calgary, Alta.—It is reported, that in order to induce the Western Canada Flour Milling Co. to locate here, the city has offered a rate of $30 per H.P. per year for power developed by gas turbines using natural gas.

London, Ont.—The British American Oil Company has secured a building permit for erection of an $8,000 warehouse on the east side of Adelaide St., between Bathurst and Horton Sts. The place will have one-storey and will be 125 feet by 40 feet.

Bedford, P.Q.—The town council are considering installing a waterworks and sewerage system. The engineer, R. d'L French, of Montreal, has reported favorably on the scheme and a by-law will probably be voted on. Pumping and filtration plants will be required.

Tenders

Fort William, Ont.—Tenders were recently called for the steel and iron work for the proposed incinerator for this city.

Calgary, Alta.—The Western Canada Brass Foundry Co. are erecting a large factory at Inglewood, East Calagry. It is expected the foundry will be working in about four months' time, and will employ from 250 to 300 hands.

Toronto, Ont.—Tenders are being called for the supply of portable sewage pumping engines. Tenders to be in by noon, Tuesday, July 29th.

Windsor, Ont.—Tenders will be received up till the 29th of July, 1913, for the construction of an incinerator. Plans and specifications may be obtained from M. E. Brian, city engineer.

Bassano, Alta.—Tenders will be rereceived by the engineers, John Galt Engineering Co., Calgary, up till 18 o'clock, Friday, 15th August, for the construction of sewage disposal works. Plans and specifications may be obtained from the engineers.

Winnipeg, Man.—Sealed tenders, addressed to the chairman, Board of Control, Winnipeg, will be received at the office of the secretary, up to 11 a.m. on Wednesday, August 6th, 1913, for the manufacture, delivery and erection in the Generating Station at Point du Bois, of two 3-phase 5,000 K.V.A. generators for direct connection to double re-action turbines, and for spare parts for same; also for one additional or extension set. Specifications, etc., may be obtained at the office of the City Light and Power Department, 54 King Street, Winnipeg.

Carlyle, Sask.—Sealed tenders will be received by F. J. Stent, sec.-treas., up till 18 o'clock on Friday, 1st August, 1913, for the following contracts:—(1) Construction of brick power house and concrete reservoir, and laying approximately 800 lineal feet of pipe in trenches, and relative works; (2) supply or air-pumping system; (3) supply of duplex steam pump; (4) supply and erection of two H.R.T. boilers and stacks; (5) supply and erection of compound vertical steam engine; (6) supply and erection of generator, exciter and switchboard; (7) supply of poles, arms, hardware, copper wire, transformers and meters; (8) supply of series Tungsten street lighting apparatus; (9) erection of pole line. Specifications may be obtained from The John Galt Engineering Co., consulting engineers, Winnipeg and Calgary.

Contracts Awarded

Westmount, Que.—The city council have awarded a contract for laying a section of a system of electric lighting conduits to R. T. Smith & Co.

Winnipeg, Man.—Carter, Halls and Aldinger have been awarded the contract for the swine barn at the new Agricultural College, St. Vital, for $12,718.

Winnipeg, Man.—Crane & Ordway have been awarded the contract for the plumbing, heating and ventilation system for the new law courts. The contract price is $119,000.

New Westminster, B.C. — Waugh, Meisner & Bailey, contractors, of Vancouver, have been awarded the contract for building a quay wall at a cost of $102,000. This is in connection with the harbor improvement scheme.

Long Branch, Ont.—The contract for the new military barracks has been let to Michael Sullivan, Kingston, Ont.

Longueuil, Que. — The Armstrong-Whitworth Co. have let the contract for the first section of their new plant to E. G. M. Cape, of Montreal.

Edmonton, Alta.—The contract for the construction of the new filtration plant was awarded recently to the New York Continental Jewel Filtration Co. at a price of $117,000. The work will be started as soon as the contracts have been signed.

Prince Rupert, B. C.—T. F. Wineland building and construction Co., of Vancouver, have been awarded the contract for the construction of the buildings in connection with the dry dock. These will include a power house, boiler house, blacksmith's shop, boilers and travelling cranes, etc.

Winnipeg, Man.—The Provincial Government have awarded the contract for the construction of the new Parliament buildings for Manitoba to Thomas Kelby & Sons. The contract price is $2,859,750. Lyall Mitchell & Co. were the only other tenderers. The architect is F. W. Simon, of Liverpool, Eng., who has opened an office in Winnipeg.

Marine

Montreal, Que.—It is reported that the harbor commissioners of Montreal propose to increase the length of some of the piers in the harbor, by 250 ft. to furnish accommodation for more steamers.

Vancouver, B.C. — Announcement is made that the new harbor commission of Vancouver is to consist of F. Carter-Cotton (chairman) and James A. Fullerton and Sam McLay.

Railways—Bridges

Ottawa, Ont.—The Pacific Great Eastern Railway has deposited with the Department of Public Works, detailed plans of its proposed railway along the north shore of Burrard Inlet, between the second narrow and Point Atkinson.

Victoria, B.C.—The Esquimault and Nanaimo Railway Co. have nearly completed the construction of machine shops for their new terminals. E. R. Doe is the contractor and the cost when completed will be approximately $100,000.

Toronto, Ont.—The Canadian Pacific Railway Company are planning to construct another addition to their coach repair department, at their West Toronto shops, located at Keele and West Toronto Streets. Through their engineer, J. Irvine, they have secured a permit from the Architect's Department for the building. It will be one storey in height, and will be constructed of brick with a concrete foundation. John Hayman and Son Company, of London, Ont., have secured the contract for the building, which will cost in the neighborhood of $26,000.

Refrigeration

Fredericton, N.B.—Searle & Lawson, Ltd., will build a refrigeration and cold storage plant.

Calgary, Alta.—The Crystal Ice Co., Ltd., have purchased a site and plans are being prepared by the architect for a new artificial ice plant. A skating rink will be included in the scheme which will cost about $200,000. The project is being financed by local business men.

General Industrial

Brampton, Ont.—Hough Litho Co., of Toronto, will build a factory here.

Brampton, Ont.—T. W. Hewetson Co., Ltd., of Toronto, will build a shoe factory here.

Guelph, Ont.—Robert Dodds is establishing a knitting factory here. Some of the machinery has already arrived.

Mitchell, Ont.—The evaporator belonging to George Joyut at Hensall has been totally destroyed by fire. It will be rebuilt.

Ottawa, Ont.—Mr. R. MacLean, Montreal, has purchased the old Warnock Mill and will convert it into a flooring and roofing factory.

Charlottetown, P.E.I.—A large warehouse belonging to A. Pickard & Co. was recently destroyed by fire. The loss is estimated at $4,000.

St. Catharines, Ont.—The Clay Products Co. have purchased a site here and will build a plant for the manufacture of bricks, tiles, etc.

Sherbrooke, Que.—The town council are negotiating with two syndicates who are considering the establishment of a woolen mill and a brush and broom factory.

Calgary, Alta.—It is reported that Union Stockyards will be established here on the same lines as those at St. Boniface. The stockyards would be controlled by the various railway companies interested.

Calgary, Alta.—The Tregillus Clay Products Co. who have established a large plant near Calgary, will soon begin manufacturing. Machinery costing $100,000 is being installed, and will soon be in operation.

Bradford, Ont.—The ratepayers will vote on August 12th, on a by-law to loan the sum of $20,000 at 5 per cent., for the establishment of a wire screen factory. The factory will employ a large number of hands.

Trade Gossip

The Monarch Motor Co., Ltd., have sold a 3-ton delivery wagon to the Steel and Radiator Co., of Toronto.

Foundrymen Organize.—A meeting of the foundrymen of the Maritime Provinces was held in New Glasgow recently, and an organization perfected, to be known as the Eastern Foundrymen's Association, having for its object the mutual benefit and protection of their general interests.

H. H. Bigert, general manager of the Canadian branch of the International Harvester Company at Hamilton, Ont., recently made the following statement: "The manufacturing department of the plant will close for three weeks. The centennial celebration following, we will close for another week. That will take the slack out of the situation, and we expect to resume operations in the morning of August 18 with a moderate sized staff. There is nothing unusual in our reposing at this time of the year. We close for two weeks every year at this period. At this time about one thousand men will stop work."

New Incorporations

The Premier Mica Co., Ltd., has been incorporated at Ottawa; capital $50,000. Head office in Toronto.

The Canadian Oil Fuel Co., Ltd., has been incorporated at Ottawa; capital $10,000. The head office will be in Toronto.

The Seed Drill and The Reaper

¶ It is an amusing, and at the same time significant fact, that men who criticize and condemn advertising the hardest are the men who advertise the least.

¶ And the most violent critic of the lot is the man who doesn't advertise at all.

¶ These men put up strange arguments against advertising sometimes, and one of their pet diversions is to compare advertising with Personal Salesmanship.

¶ To compare Advertising with Personal Salesmanship is to compare the Seed Drill with the Reaper.

¶ They are separate and distinct. Each performs different functions, yet each are necessary for the common good.

¶ They work together, in the same field, for the same man, to the same end.

¶ Advertising is the Seed Drill of Modern Commerce.

¶ It plants the Seed of Good Will in the minds of prospective customers. The seed grows to interest, and interest turns gradually into a desire to possess. The harvest ripens and is garnered in by the ever-ready salesman.

¶ The Salesman is the Reaper of Modern Commerce.

¶ He reaps where advertising has sown.

¶ Advertising performs the missionary, the educational and the preliminary work—The Salesman comes along and with minimum exertion carries away the order, and, frequently, all the glory of securing it.

¶ He reaps most who sows the best, and a just man will not forget the seed drill when the reaper is at work.

Obituary

Daniel Smith, Provincial Factory Inspector for Manitoba, died in Winnipeg on July 12th, aged 73 years. Mr. Smith was born in Bristol, Que., in 1840, and located in Winnipeg in 1882, being appointed superintendent of works, which position he held until 1900, when he retired into private life.

Catalogues

Wm. & J. G. Greey, Toronto, have sent us a bulletin describing some of the equipment which they handle, such as baking machinery, transmission machinery, paint mills, etc.

The Veeder Mfg. Co., Hartford, Conn., have sent us a copy of their latest catalog No. 109, describing their "Veeder" counters, which are made in several types for application to automobiles, generators, machine tools, etc. Each type is fully described and illustrated.

The Greenfield Machine Co., Greenfield, Mass., have sent us a pamphlet describing their Greenfield Universal Grinder. We understand that this machine was designed for the tool room, for grinding cutters, reamers, arbors, etc. A copy will be mailed on request.

Gooley & Edlund Co., Syracuse, N.Y., have sent us a little pamphlet dealing with the Briggs High Duty Milling Machine. The machine is described fully, and, we understand, was designed principally for form and gauge milling of steel parts of guns, automobiles, etc. Copies may be had by writing.

The J. W. Paxton Co. have sent us a copy of bulletin No. 30, describing the various brushes and brooms which they manufacture. These brushes have steel wire bristles, and are intended for use in the foundry, but are also supplied to textile mills, pattern shops, etc. Copies will be sent to interested readers.

George Swift & Sons, Halifax, Eng., have sent us copies of catalog No. 29 and 151 which describe the line of machine tools which they manufacture, the principal ones being high speed lathes and radial drills. A general specification is given for the lathes, and other machines are illustrated and described. Copies of these lists will be gladly sent to interested readers.

W. H. BANFIELD & SONS
120 Adelaide St. W., Toronto

The Standard Ideal Company, Ltd., of Port Hope, have issued a new Catalogue F. on drinking fountains. This book should be procured by every one in the trade, it is well got up in every detail and has complete sets of "Roughing in." Measurement plans of all styles and sizes of goods illustrated. Another good feature found in this book is a cut of their guarantee labels.

The Lansing Company, Lansing, Mich., have sent us a copy of their new catalog No. 110, which describes and illustrates fully the complete line of concrete working machinery which they manufacture. This line includes pipe moulds, brick and block machines for any pattern, ornamental moulds, tools, etc. The catalog is very complete, and the illustrations are clear.

The Lea Equipment Company, Philadelphia, Pa., have sent us a copy of Bulletin "C," which is a description of the improved Lea-Simplex Cold Cutting-off Saw. The Lea-Simplex Saw is made in three sizes, is motor or belt driven, and is designed to cut cold metal. A detailed description is given of the saw, the principal features being clearly explained. A specification is also included for each side. The "Simplex drive" is one of the features of this machine, as it is claimed that there is no backlash, the saw blade being driven by a sprocket which engages in slots in the blade. Copies of this bulletin may be obtained on application.

The S. F. Bowser Company, Fort Wayne, Ind., have sent us a copy of their new bulletin, entitled "A Collapsible Oil Filter," and also a set of circulars descriptive of the various types of oil filters which they manufacture. The bulletin contains a complete description of the collapsible filter as applied to the "Bowser" oil filtering and circulating systems with illustrations. There is also some interesting information on the subject of lubrication and photographs of plants where the "Bowser" system has been installed. Copies will be sent on application to the Canadian office at Toronto, Ont., or to Fort Wayne.

SECOND HAND MACHINERY FOR SALE

JUST AS YOU were attracted by the Caption "Second Hand Machinery for Sale," so will hundreds of other men all over Canada.

WHY NOT ADVERTISE that machine of yours that is getting too small or that isn't quite suited to the work for which it was intended?

Let "CANADIAN MACHINERY" find a buyer for your machinery or let it find you a second hand machine if you need one. Let "CANADIAN MACHINERY" connect you with good men if you are looking for them or with a better job if you desrve one.

Let it sell for you or buy for you, be it a factory or a machine, a man or a job.

"CANADIAN MACHINERY" is the Market Place for Machinery and Metal Men. Come to it if you wish to buy or sell.

Rates for a stand in the Market Place are 2c per word first insertion, 1c per word each subsequent insertion. Each figure counts as one word.

Ideas at Two Cents Each

¶ An idea that's worth anything at all to a Mechanical man is worth more than two cents.

¶ It might be worth hundreds of dollars.

¶ Every issue of "CANADIAN MACHINERY" is full of practical, helpful ideas. You ought to be able to sift out four each month that would prove of some use to you. Put a value of two cents on each and your subscription has been paid.

¶ You cannot afford to miss even one issue—you might miss the idea that would be worth hundreds of dollars.

¶ The date on the label of your "CANADIAN MACHINERY" wrapper shows when your subscription expires. One dollar will renew it for a year.

Don't put off Renewing—Do it to-day

Do Your Stools Break?

Have You Replacing Expenses?

The trouble with the ordinary stool is the constant expense of replacing because they break so easily.

Our stools are practically indestructible and help to keep expenses down. They are just as neat in appearance as other stools plus the **lifetime service and economy.**

We make Wire Guards for all purposes. Tool Room Partitions.

Send a post card for full particulars and descriptions.

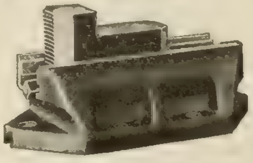
Morrow Drill Chuck



New Face Plate Jaws

A Chuck For Every Purpose

Look Over This Complete List

Iron Body Indpendent Chucks, Steel Body Independent Chucks, Face Plate Jaws (Iron and Steel), Boring Mill Jaws (Iron and Steel), Geared Screw Chucks (Universal and Combination), Universal and Independent Two-Jaw Chucks, Geared Scroll Chucks, Drill Chucks, Planer Chucks.

It pays to send your inquiry to a manufacturer who is familiar with all types. You not only get better advice and explanations as to comparative features but often we can save initial cost by advising a lower priced chuck that will do the work.

Write for our 48-Page Condensed Catalog—full of distinct specifications and details, or ask regarding delivery and special service in the Dominion.

E. Horton & Son Company, Windsor Locks, Conn.

"CUSHMAN" CHUCKS

are generally known as the "heavy pattern," being designed for hard service.

Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.

Our line consists of many styles and sizes of Lathe Chucks, Drill Chucks, Centering Chucks and Face-Plate Jaws.

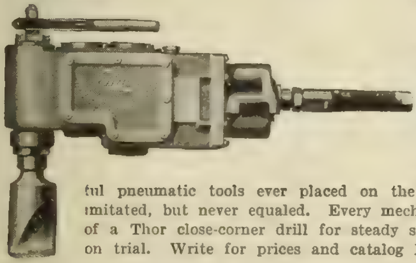
Thor **CLOSE-QUARTER PISTON AIR DRILLS**



Are the original Nos. 8 and 9 motors for close-corner work. The neat and compact construction of these **drills, together** with the design of the mechanical parts, have resulted in their becoming the most successful pneumatic tools ever placed on the market. They are often imitated, but never equaled. Every mechanic appreciates the value of a Thor close-corner drill for steady service and economy. Sent on trial. Write for prices and catalog No. 9.

MACHINERY REPAIRS

When a break-down occurs in your factory, necessitating repairs, a temporary "tie-up" is inevitable in almost every case.
In a busy plant, "tie-ups" are expensive. We appreciate this fact, and when called upon, "get on the job" **without delay** and remedy the trouble quickly.
Try us—you will find our prices right, our workmen courteous and obliging, and our service unexcelled.

Don't Be a Commercial Explorer

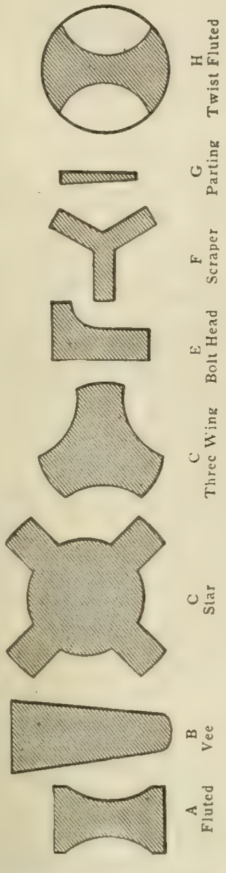
¶ You haven't time to go exploring round on your own account discovering who's who in machinery and supplies.

¶ Time is too valuable these days.

¶ If you want to buy a machine or piece of equipment the easiest way is to consult this Directory.

¶ *The firms represented here are modern, reliable*, and their prices are right, and *they are already on the map.*

Use this modern guide to good buying.



H Twist Fluted

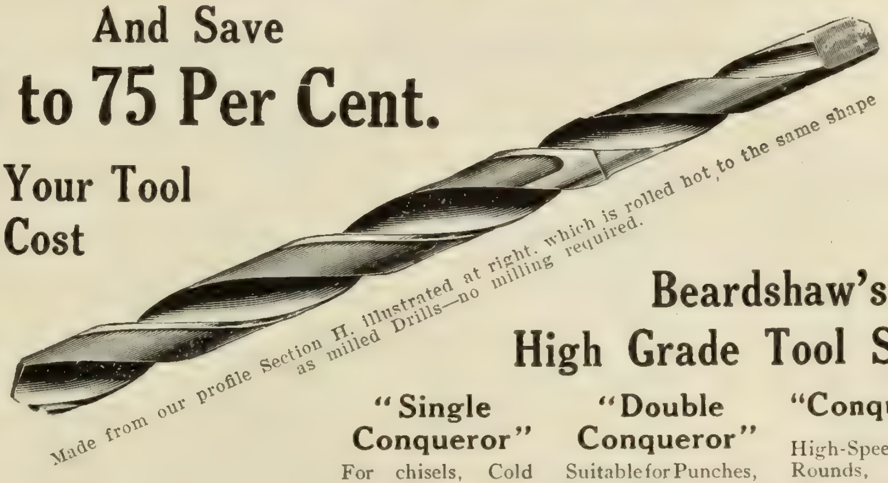
C Three Wing
C Star
B Vee
A Fluted

Make Your Own Twist Drills and Reamers From "CONQUEROR" BRAND Profile Sections

(Easily Ground—No Forging Required)

And Save
50 to 75 Per Cent.
On Your Tool Cost



Made from our profile Section H. illustrated at right, which is rolled hot to the same shape as milled Drills—no milling required.

Beardshaw's High Grade Tool Steels

"Single Conqueror"	"Double Conqueror"	"Conqueror"
For chisels, Cold Sets, Mining and general use.	Suitable for Punches, Taps, Dies, Snaps, Shears Blades, etc.	High-Speed Steel in Rounds, Squares, Flats, also Profile Sections.

Our **New "Invincible" Brand High Speed Steel** is the best on the market—try it and see for yourself.

Metal Cutting Saws and High Speed Drills.

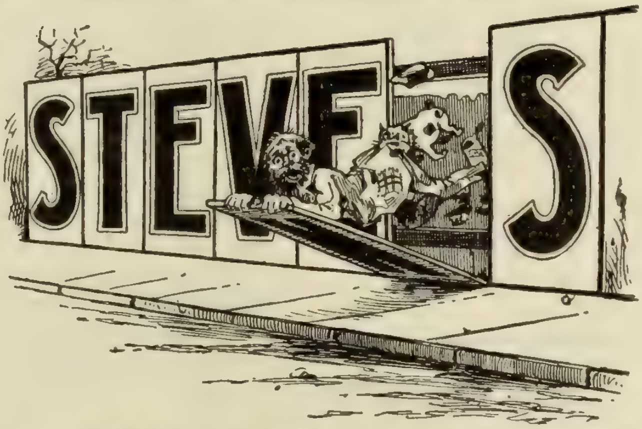
Geo. D. Hatfield, Halifax, N.S.



THE MISSING LETTER

You know the beautiful, blue, smooth surface of a Casting is one of its essential qualities.

You know its appearance acts as a silent salesman for that same casting.

You know, also, that the cost is less when the Foundry produces this effect without the aid of the Scratch-room or the Chipping gang.

You, perhaps, know it is possible to procure a Plumbago-Ceylon Lead—that will produce that effect.

Perhaps in the mazes of substitutes sailing under a similar name you have forgotten that I import from Ceylon's Coral Strand just that kind.

Its cost is less—at the end.

The same high standard of excellence pervades, with pocket-book popularity, my entire line of Foundry Facings and Foundry Supplies.

If your letter of inquiry is not missing in my mail, I will tell you more about it.

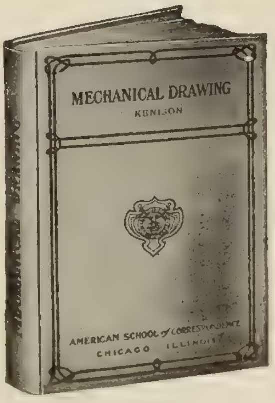
Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

MACHINE SHOP WORK
TURNER

MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50



MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price $1.00

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

MACHINE DESIGN

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price $1.50

FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.00

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.50

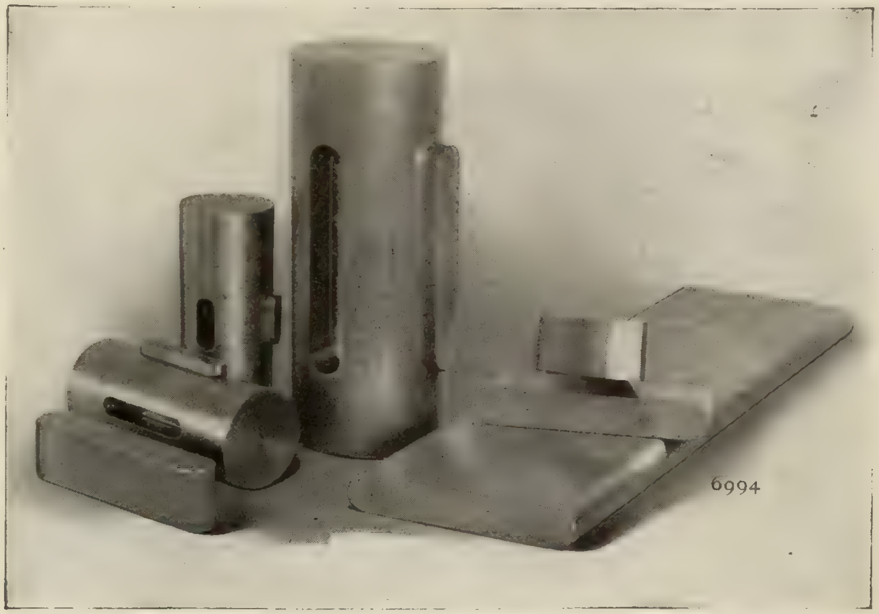
With This Machine You Can Use Rectangular Keys Profitably



For many reasons, some of which are enumerated below, the rectangular type of key shown here is considered superior to any other. Until the development of the

P & W Spline Milling Machine

the excessive cost of milling the keyways has prevented their commercial use. With this machine the keyways are milled in one simple, rapid operation.

Rectangular Keys by far the most Efficient and Economical

1. They do not materially weaken the shaft.
2. They will not work loose.
3. Their shearing strength is practically equal to a solid member.
4. Two keys may be placed opposite each other on the shaft.

Cost of Cutting Keyways Greatly Reduced

For keyways and slots the Spline Milling Machine has proven the greatest labor saving machine that has ever been produced. The metal is removed very rapidly and an accurate keyway or slot is cut in a remarkably short time. Automatic features enable one operator to take care of from six to eight machines in some instances.

Accurate Machine Keys Ready to Drive in without fitting, any width, depth or taper; finished and guaranteed to micrometer measurements, can be obtained from the STANDARD GAUGE STEEL COMPANY, BEAVER FALLS, PA.

Write for descriptive circular "Spline Milling Machine."

"BEMIS & CALL"

Adjustable "S" Nut Wrench

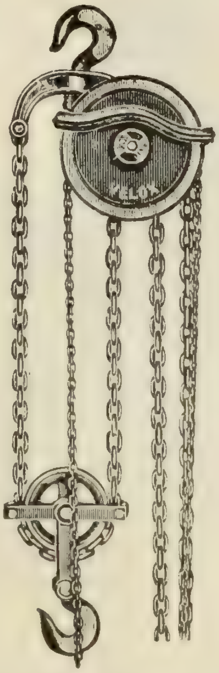
Proves Itself Invaluable, Because

it works efficiently in corners and confined places where an ordinary wrench would be nearly useless.

All parts are strong and durable—the operating nut is steel, and the sliding jaw a steel drop forging. Hardening and tempering are done by experts.

Send us a card for complete catalog on wrenches.

BEMIS & CALL HARDWARE AND TOOL CO.
SPRINGFIELD, MASS., U.S.A.



THE BEST WAY

to handle from $1\frac{1}{2}$ ton to 5 ton is with a

Velox Chain Block

It will always run easily, smoothly, and quickly.

You can lift and support a weight, at a given height more quickly and with less effort whenever you use a Velox.

HIGH SPEED
BRONZE BEARINGS
ALL STEEL CUT GEARS
ALL PARTS DUST PROOF
HIGHEST EFFICIENCY.

Gridley Automatics

Guarantee

Greater Accuracy, Larger Output and a Wider Range of Work

These **Automatics** are free from many small parts which make all others so complicated.

You can change the tools on a "Gridley" as quickly as you can on a hand machine.

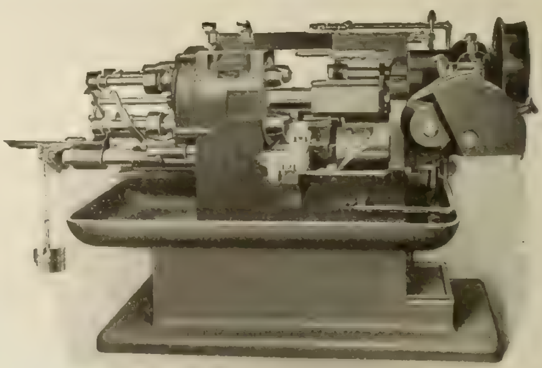
The idle movements are always at constant speed—much faster than others—which helps toward a faster production.

One man can operate from 3 to 6 machines at once, and can use tools tandem when rapid production is neecssary, hence a saving of labor.

IT WILL GREATLY INTEREST YOU
TO STUDY THE GRIDLEY CATALOG.

Write for it **to-day.**

We manufacture both multiple and single spindle automatics.



"GRIDLEY" Multiple Spindle

The "Gridley" Differs

from all other Automatics in the manner of supporting tools, and in the arrangement of the holders on the tool slides of the turret.

On all other Automatics there is an overhang of the tool. This overhang prevents the performance of accurate work, because the method of supporting tools doesn't permit as heavy cuts or as coarse feeds.

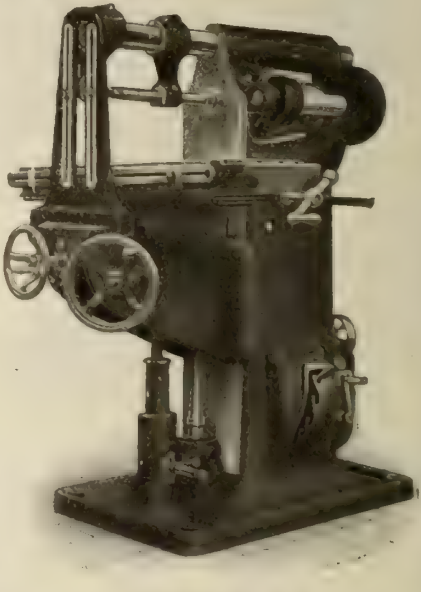
S. & S. Millers

Made in 5 sizes of Plain and 4 sizes of Universal Machines.

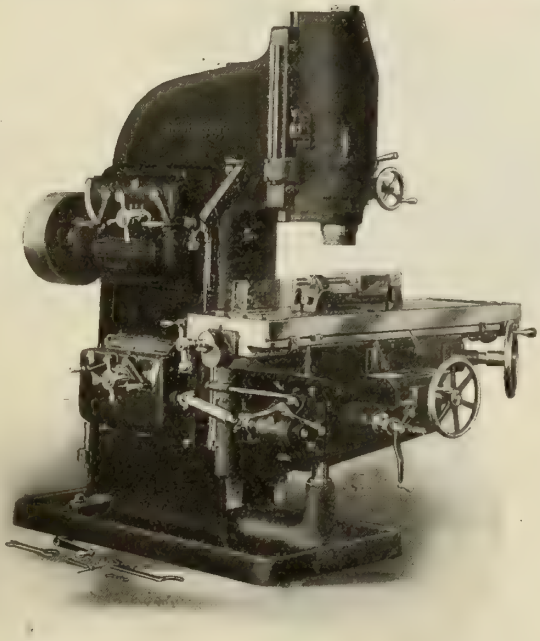
Investigate these Machines at once—we will gladly furnish you with catalog and full information.



PLAIN MILLER—No. 6

Schuchardt & Schutte, 307 Coristine Bldg., Montreal

High Power Vertical Cincinnati Millers



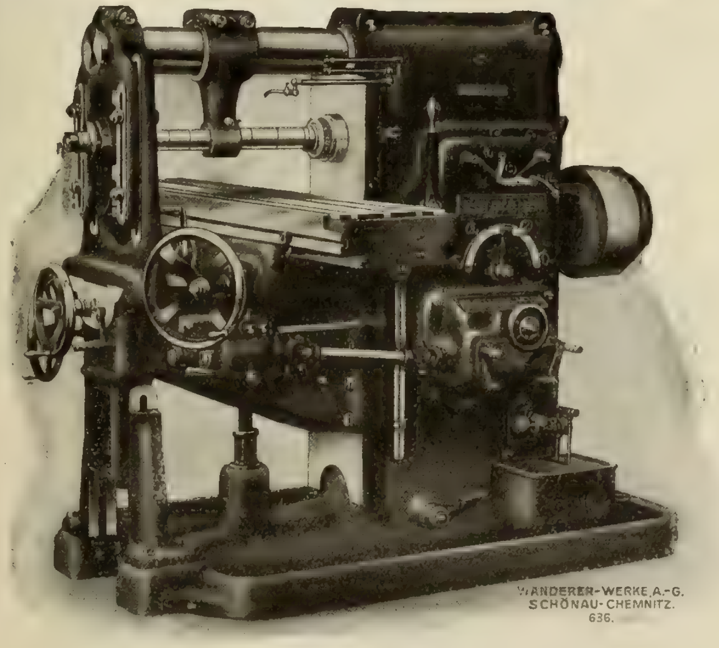
are made in 3 sizes—28″, 34″, and 42″ table travel, and of 5 h.p., 7½ h.p. and 10 h.p., respectively.

Heat Treated Alloy Steel Gearing; locked tumbler; treadle for quick speed changing; direct reading feed and speed index; quick pitch feed screws; single plunger trip; feed levers control reverse and always indicate which way the table will move; sight feed oilers. THE SPINDLE HEAD is made in large proportions—see illustration; head can be securely bolted to the column when doing heavy milling. THE DRIVE is always through the main gear close to the lower bearing. THE SPINDLE BEARINGS are always the maximum distance apart.

Because of all these features these machines have greater cutting capacity than other Verticals of equivalent size.

The Cincinnati Milling Machine Co.

Canada Agent: H. W. Petrie, Ltd., Toronto, Montreal **CINCINNATI, OHIO, U.S.A.**



No. 4, PLAIN MILLING MACHINE.

Table Surface, 67″ x 18½″. Table Feeds, 44″ x 12½″ x 20″.

Wanderer Milling Machines

are unsurpassed for modern design—first-class material—accuracy and output; over three thousand in use; they are built with single pulley drive and cone drive.

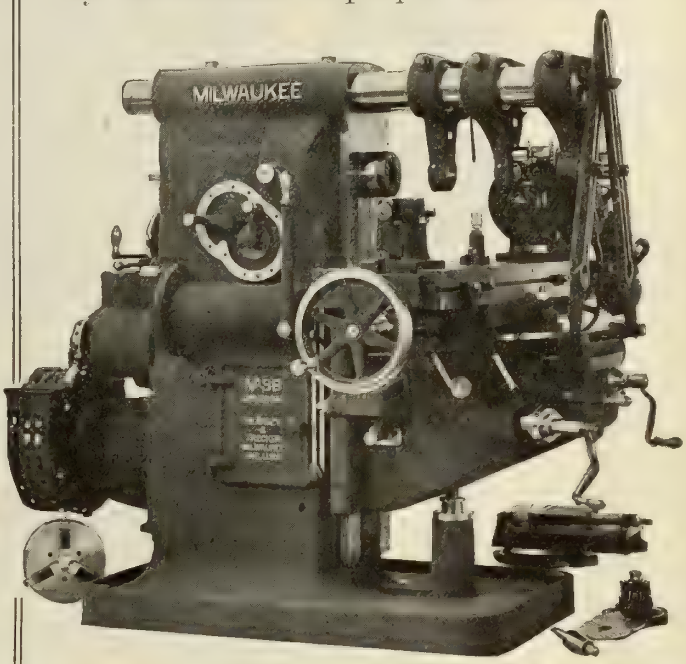
Real Progress

lies in the betterment of certain conditions, the correction of certain evils. The extent of real progress is gauged by the number of people benefited.



DOUBLE OVER-ARMS

Are Very Real Progress in Milling Machine Construction

Because they correct three unsatisfactory features of milling machine construction and thereby benefit every milling machine user. The unsatisfactory features remedied are—

First. Double Over-Arms provide a means of positively aligning the cutter arbor and of keeping it true, eliminating the evil of relying on the cutter arbor to align the bearing.

Second. Double Over-Arms secure a rigidity which permits the use of large, coarse-pitch cutters on rough, heavy work at a much greater distance from the face of the column, eliminating the necessity of carrying certain classes of work to the planer.

Third. Double Over-Arms render it impossible for the cutters to pound the bearing gradually out of line.

The Double Over-Arm construction is the culminating point of a series of really progressive improvements which have distinguished MILWAUKEE MILLERS.

Let us send you full particulars.
It will be to our mutual advantage.

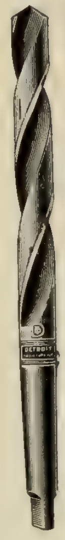
The Test of a Drill

is what it will do, and the cost of a drill is measured by the results obtained—not by the purchase price.

The daily grind can be made easier and more economical, can be made to increase efficiency and decrease production costs by the use of



Trade Mark

“Detroit” Twist Drills

Trade Mark

How is it in *your* plant right now? What are the drills you now use *costing* you? Not what *did* they cost you—for initial expense is only one factor in drill expenditures.

To that must be added loss in time—man's time and machine's time—required for the frequent regrinding and retempering necessary where inferior drills are used.

“Detroit” Twist Drills save time on every operation. They cut the most metal with the least regrinding and they will not prove “soft” at the center when they go to the grinder.

In the manufacture of all “Detroit” Tools nothing is left to chance or guesswork. Every operation is accurately and scientifically performed and we maintain a rigid system of inspection.

This insures to every user the utmost in drill value. And this value is backed by our absolute guarantee of satisfactory service or a refund of the purchase price.

We make all kinds of small tools and would like to supply your needs. We have the experience, the equipment and the determination to make our service the most satisfactory you have ever known.

Proved by a test.

Lightning Instruction

(World's School of Technology)

Ques.—What is the basic principle governing the prevention of friction in designing metal cutting tools?

Ans.—The support back of the cutting point or edge must be relieved to prevent dragging, tearing and consequent heat.

Ques.—Cite an example where this principle is in practice?

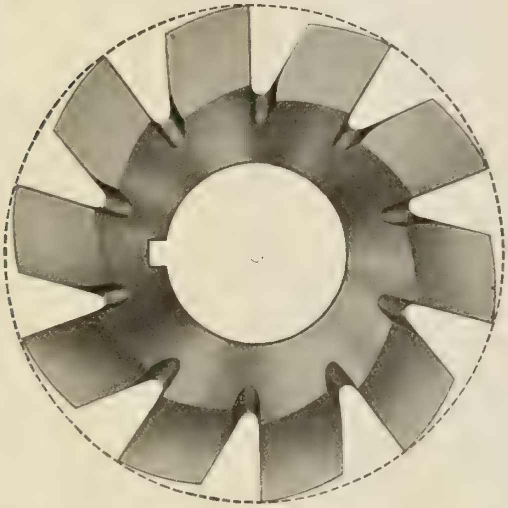
Ans.—Milling cutters—the photo attached illustrates the idea.

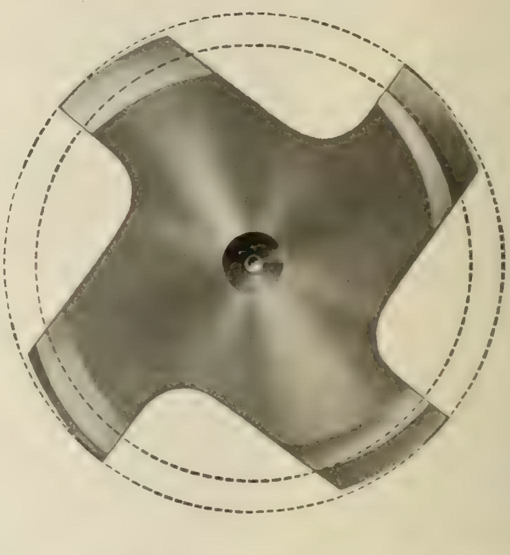
Ques.—Name other tools which should be governed by this same principle?

Ans.—Taps, Lathe-tools etc.

Ques.—Are taps always formed after this manner?

Ans.—No. Strange to say there is but one Tap on the market with this scientific relief **built in.** It is called "Lightning" by the manufacturers. An end view of one is given in the attached photo.





"Lightning Taps" are different from all other taps of whatever name or nature.

They are different in **design**; they are **made** differently; they **act** differently when at work.

They are just as economical in **practice** as they appear to be in **theory.**

If you don't know "Lightning" Taps, you ought to.

6"x6", 8"x8", 9"x9", 10"x10", and 12"x12".

WHY PAY MORE?

You'll have to pay for the difference between the power your compressor consumes and the power it makes available; but if you use a

Curtis Air Compressor

you will pay considerably less than with many other makes.

1—BECAUSE: Less friction loss. The Curtis have no piston rods, no stuffing boxes, no crossheads and no guides, hence require less power, less oil and less attention.

2—Less loss of power through shrinkage due to cooling of the air after compression. Curtis cylinder heads and valves, as well as cylinder walls, are water cooled, and air is delivered at low temperature.

3—Volumtric efficiency is higher—capacity is equal to 95% of piston displacement.

4—Curtis will keep up its high efficiency, as is shown by their being used in twenty-four hours daily service and records of fifteen years and over in service.

Let us send you Catalogue C-1 and prices.

To Every Hack Saw Consumer in Canada

The Victor Saw Works, Ltd., announce the establishment at Hamilton, Ont., of a new, complete and splendidly equipped plant for the manufacture of the famous

VICTOR HACK SAWS

The coming of this new industry to Canada is the direct result of the unqualified favor which Victor Hack Saws have met with throughout the Dominion since the day of their introduction.

Heretofore, the Canadian trade has been supplied by the parent company, The Massachusetts Saw Works, of Springfield, Mass. The demand for Victor Saws, however, has grown to such proportions that a

Complete New Plant at Hamilton

has been established in order to give Consumer and Dealer the benefits of home manufacture and better service.

Here, as in the United States, it will be the single purpose of this company to produce the best Hack Saw that can be manufactured. The Victor Saw Works, Ltd., is built on the conviction that quality is **everything** in Hack Saws. The Company believes—**and its unusual success proves that belief**—that Victor quality makes Victor Saws **by far the cheapest** in the market to-day.

Although only 8 years old Victor Hack Saws are now used all over the world.

No other hack saws are so **scientifically designed.**
No other hack saws are so **expensively made.**
No other hack saws are so **rigidly inspected.**

As a result, Victor Hack Saws have changed the entire point of view as to what a hack saw **can** and **should** do. They have **definitely standardized** hack saw efficiency.

To Consumers we say:

No hack saw problem is too small for our attention. If we have no saw in our extensive list that fits your work we will make one for you.

To Dealers we say:

Victor quality backed by Victor service is unbeatable. We add to these a definite plan of sales cooperation that helps all through. Write us for information. Write to-day.

VICTOR SAW WORKS, Ltd.

ADAM STREET HAMILTON, ONTARIO

STARRETT
HACK SAWS
CUT QUICKER
LAST LONGER

What Is Your Hack Saw Problem?

Are you "up against it" in your shop on the hack saw problem? Do you find that your power machines are too hard on the blades you're using? Do the teeth break out? Do the saws get dull too quickly? Do they stand the strain put upon them by the high speed power hack saws that economical cutting to-day demands? We know that we can solve your problem with a

Starrett Hack Saw

because we have helped out so many others in the same way. There's a Starrett blade for every job. Some one of the full line of hack saws is just what you need whether you're cutting sheet metal or tubing, or girders.

Catalog No. 193 contains some good saw information. May we send it?

WHY DOES THIS MAN USE
Aloxite Cloth?

THE answer is the results he gets.—He is rubbing down cast-iron ram slides for shapers—the finish must be almost mirror like. —He is using Aloxite Cloth because it gives him just the finish he desires—because it cuts clean and quick—shows long life—the grain stays on and the cloth does not fill readily.

Aloxite Cloth is the cloth that cuts. —It is far superior to ordinary emery cloth—cuts faster—gives a better finish—lasts longer.

All good reasons why it should be used in your plant—on any work. Supplied in reams, sheets or the handy economy rolls.

Tools of Quality

W&B

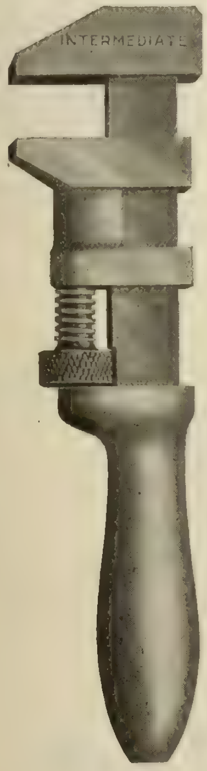
Bear These Marks

"W&B" Wrenches Have The Never-Wear-Out Wrench Efficiency

Tools of Quality

W & B CO

Bear These Marks



Take any "W & B" Screw Wrench and you will find the jaws stand up under severe strains better than other makes.

The head and bar are drop-forged in one piece. This method strengthens the grain of the steel, making the molecules more compact.

The old style "upset" method, whereby the grain of the steel was broken and disturbed in bending, weakening the wrench at the head, is not used in manufacturing "W & B" Wrenches.

The grip on the handles of "W & B" Wrenches is better than other makes.

They are not ungainly nor fatiguing to handle.

"W & B Diamond" Trade Marked Wrenches command the largest market of any.

We can pack in one shipment more high class Wrenches—Screw and Drop-Forged—than any other manufacturer in the world.

YOUR DEALER WILL SUPPLY YOU. In case he is out of stock and you are delayed in getting your orders filled, write us direct. We will see that you are supplied.

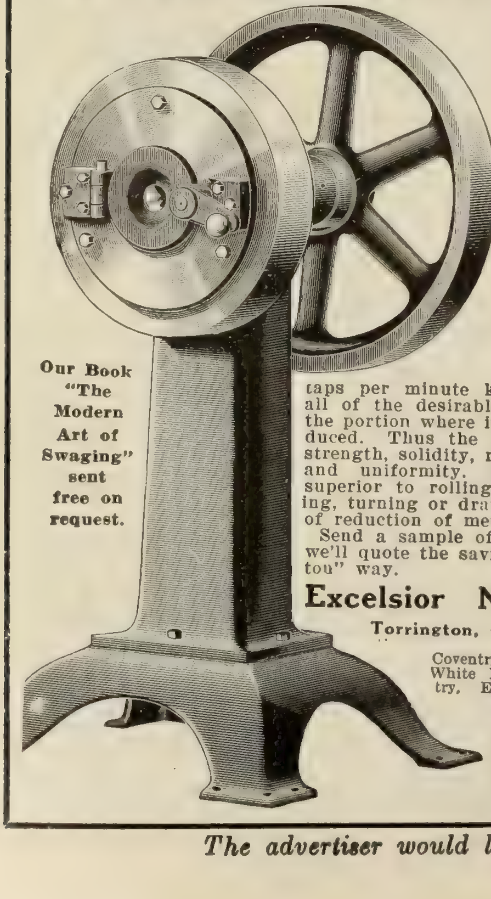
REDUCE METAL
WITHOUT WEAKENING IT



Swage The Dayton Way

The Dayton Swaging Machine does not sacrifice one particle of strength of the metal being reduced. From 2,000 to 6,000 taps per minute knead or squeeze all of the desirable quantities into the portion where its diameter is reduced. Thus the metal has added strength, solidity, rigidity, elasticity and uniformity. Swaging is far superior to rolling, grinding, milling, turning or drawing as a means of reduction of metal.

Send a sample of your work and we'll quote the saving by the "Dayton" way.

Our Book "The Modern Art of Swaging" sent free on request.

This is the Machine

that has found so much favor in shops where small parts are threaded.

The Geometric Threading Machine

is not an ordinary bolt cutter. It is a machine for threading duplicate parts correctly and rapidly.

Fitted with one of our Style "D" Die Heads, and perfected in every detail.

The Die Head opens and closes automatically. The operator starts the work in—the thread is cut. He releases the work, and placing in the new piece, the Die Head is closed ready for cutting the thread. Thousands of threaded pieces are turned out each day by one of these machines. The only interruption to continuous threading is for the work to be removed and the new piece placed in.

From ⅛ in. pipe thread to 1 in. diameter is the usual range of the machine, but where fine pitch threads are to be cut on larger diameters, a Die Head can be supplied that will take care of the work.

Submit your threading proposition to us.

HEALD GRINDING MACHINE

RAPID PRODUCTION—WHY?

Because each HEALD grinding machine is designed for a special purpose, to do common things uncommonly well. HEALD **INTERNAL** GRINDING MACHINES are made for the express purpose of grinding **holes**, nothing else. Any progressive country doctor may be all right to handle a **case of measles**, but for the **latest up-to-date** information you would call on a **specialist**. For the same reason, if you have any holes to grind you should call on us because we are **specialists in this line.**

The above illustrations show one of our internal grinding machines equipped with one of our universal bushing chucks designed for holding thin bushings. This illustrates the attention given to detail in any grinding problem. A thorough explanation of this fixture, together with a lot of good practical help on internal grinding is contained in our booklet "PRACTICAL HINTS ON INTERNAL GRINDING," which will be sent free upon request.

THE HEALD MACHINE COMPANY

8 NEW BOND STREET, WORCESTER, MASS.

Firth's Tool Steels

are not an experiment. For three generations they have held a premier position in the Metal markets of the world, and their ***uniform good quality*** is proverbial.

With established works in Sheffield, England; Riga, Russia; McKeesport, Pa., and Washington, D.C., Firth's products are held in high repute in every country where steel is used.

SPEEDICUT

High Speed Steel

(our latest improved) unequalled for ***rapid cutting*** and superior to all other brands for ***heavy service on hard metals.***

FIRTH'S **EXTRA** and FIRTH'S **BEST**

Standard brands of **Carbon Tool Steel,** in all leading sizes, **Annealed and Un-annealed.**

The largest Stock of High Grade Tool Steel in Canada.

BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

"THE TOOL HOLDER PEOPLE"

306 N. Francisco Avenue **CHICAGO, ILL.**

What is the "FILE HOUR" Cost in Your Shop ?

YOU may have a big payroll to meet Saturdays, and high fixed charges on your plant. One of the best minor economies is to have your men work with new and sharp "Nicholson-made" Files.

A $3.50 man at a bench, who uses a file continuously, is efficient as his 20-cent file is efficient. An over-used 20c file may cost you $1.00 to $1.25 a day by absorbing your $3.50 man's energy in muscular effort to make it cut, when you are paying that man for dexterity, speedy work, clean and exact work, and judgment.

Give such a man as many as 3 "Nicholson-made" Files a day, costing 20c each, or 60c. If his output is increased by 15 per cent., it pays. His output may increase over 15 per cent. The plan pays still better.

A high cost for files in your shop, per hour, corresponds to a high output rate on finished product. Be lavish with 20c file units, as you thereby get full advantage of $3.50 man-power units applied to production.

"Nicholson-made" Files in special steels, individually hand-tested at the factory, are as unvarying as skill and experience can make them. They make possible the determination of exact length of shop service that is best for your shop efficiency. For sale by all jobbers.

Nicholson-made File Brands:
American, Arcade, Globe, Gt. Western, Kearney & Foot.

Shipping room floor (5,500 sq. ft.) of Hiram Walker Sons' Distillery, Walkerville, Ontario.

J-M MASTIC FLOORS

Withstand Severe Usage

It takes a tough floor to support heavy machinery and withstand the grinding of heavy trucks and the wear-and-tear caused by moving barrels, boxes, etc.

J-M Mastic won't crack, split or crumble when subjected to this sort of usage. Outwears any other type of floor, and is practically indestructible.

The cementing agent is genuine Trinidad Lake Asphalt—the most durable waterproofing elastic mineral cement in existence. Mineral through and through.

Being waterproof, it can be quickly cleaned by flushing. It dries immediately. Absolutely sanitary—will not originate or hold dust. Not affected by acids. Will not absorb oil, grease or filth.

Slipping is impossible on a J-M Mastic floor on account of its peculiar "holding" quality. Because of its resiliency, it does not cause foot-soreness and fatigue. The cheapest per-year flooring material on the market.

Write our nearest Branch for full particulars.

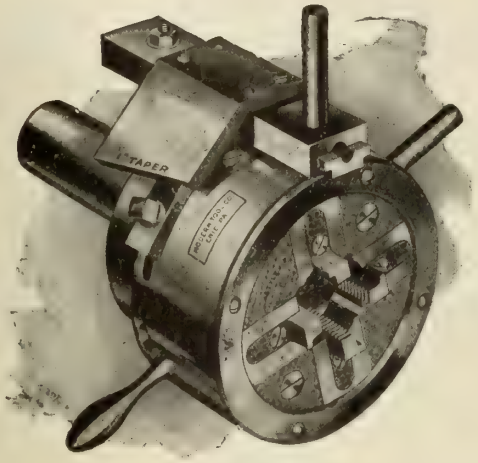
Two History-Making Tools

Why Not Cut Your Taper Threads With a "Modern" Special Taper Threading Die?



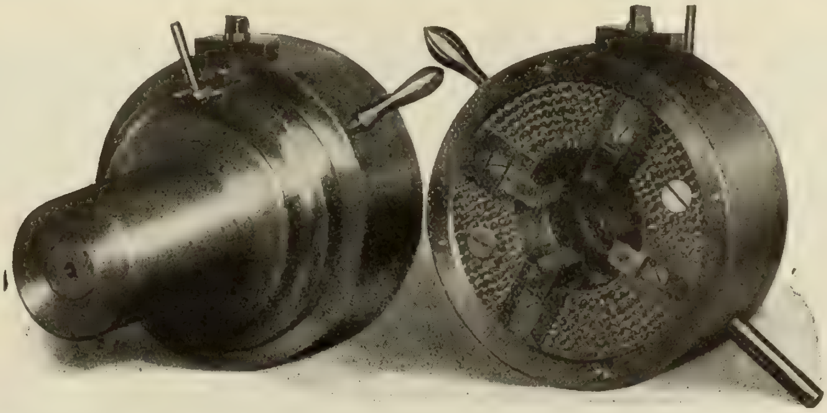
It has been proven that the most rapid, accurate and efficient method is by the "Modern" Taper Theading Die. Manufacturers appreciate the precision of the Taper Die on such work as Locomotive Mud-plugs, Stay-bolts, Corporation Cocks, Buffing Lathe Spindles, Special Faucets, Etc.

Send us a Sample of your taper threading work—no matter what the diameter of pitch —and let us recommend an equipment.

"Modern" Self-Opening Dies

Always Combine

Efficiency, Reliability and Accuracy



If you are using solid die methods for thread cutting you need "Modern" Self-Opening Dies —need them because they'll save an actual 50 to 80 per cent. in time, because they save the wear and tear of constantly reversing machines, because they cut flush to shoulders and any length the turret slide will allow, because adjustments for either tight or loose-fitting threads are easily made, roughing and finishing attachments are furnished where large quantities of stock are removed, and special pitch or pipe threads can be cut to any size within the capacity of the Die.

An opportunity to estimate will be greatly appreciated. In any case we will be pleased to answer your inquiries. And, by the way, can we not send you our catalogue on the "Modern" Self-Opening Dies? We will gladly do so if you desire it.

From Punta Arenas to Ketchikan You Can Find Magnolia Metal

Apsley Rubber Co.,
Hudson, Mass., Sept. 30th, 1911.

Gentlemen:—

In reply to your letter dated Sept. 18th, I have to state that my experience with MAGNOLIA METAL in the past, when I was Chief Engineer, at sea, is wholly in its favor, and I shall at all times advocate its use. On the "S.S." Hesione, of Liverpool, I had to get a crank pin brass re-metalled at Buenos Ayres, 18 in. x 18 in., and when I left the ship three years later, it was in excellent condition, the wear extremely small, and the running conditions most satisfactory. This also applies to a guide shoe re-metalled at the same time, in addition to many other places where I have had experience of its qualities.

Yours faithfully,
F. W. WADBROOK,
Chief Engineer.

Gear Data for Note Book

Bevel Gear Shapers

from the HAMILTON GEAR & MACHINE CO., Toronto

There are two makes of Bevel Gear Shapers in common use—the Gleason and the Bilgram. We use the Gleason in both of its two forms and find them highly satisfactory for rapid, accurate work. The Bilgram machine produces very accurate gears, but is not built in the large sizes we require. Our capacity is up to five feet diameter for bevels.

The larger Gleason shapers use a single tool. The guides which carry the shaper ram are pivoted at the exact cone centre of the gear being cut. The other end of the guides is controlled by a standard templet of extreme accuracy.

The smaller machines work on the Generating principle. There are two shaper tools with straight cutting edges. These are placed so that they correspond to the straight-sided teeth of a crown gear, and the part of the machine that carries the tools is rolled, relatively to the gear blank, the same as a crown gear would roll with a gear like the one being cut. This gives a theoretically perfect tooth form, and also a fine finish.

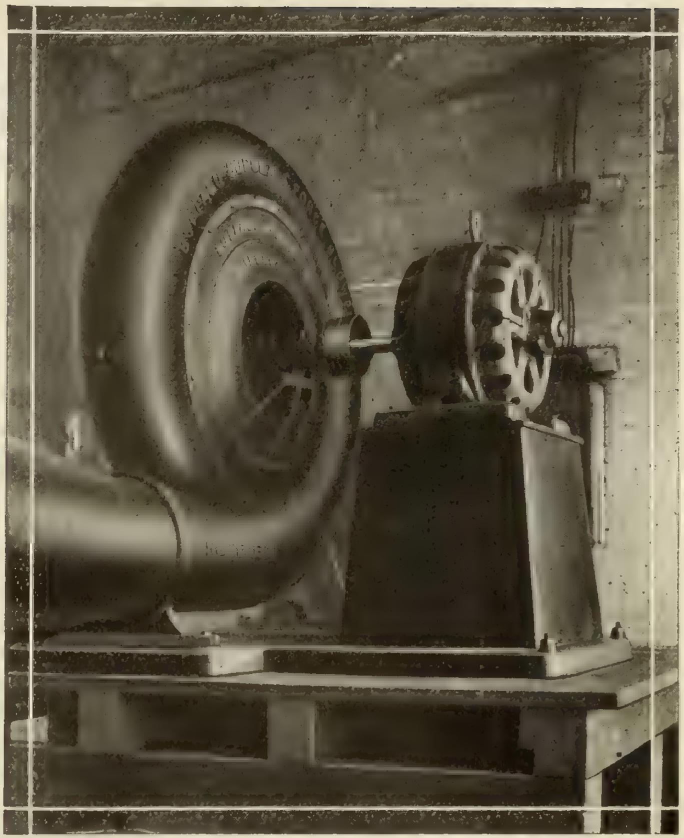
CHICAGO SUBURB.



A Healthy Family

The above is one of four sister outfits installed successively for the malleable furnaces of the Cleveland Hardware Company.

The first one was ordered in 1906, the second in 1907, the third in 1910, and the fourth in 1913—all identical. ''Nuf sed,'' to use the vernacular.

Some foundrymen seem to think that a direct-connected motor-driven blower unit uses more power than a belt-driven one.

The reverse is the case with ''Buffalo'' units, because slippage of belts is avoided.

BUFFALO
Direct-Connected

Blowers and Exhausters

have been demonstrated to cost less for power and maintenance combined than any positive type of blower. And, what is more important, they avoid **interruptions and costly delays, and maintain their original high efficiency for a lifetime.** This is, of course, due to the absence of belts and of any wearing parts except the bearings. These are of the approved ''Buffalo'' double oil ring type, unequalled for reliability.

Tell us the work your blower has to do and we will advise you what a direct-connected Buffalo unit will cost to purchase and operate.

Our Electric Fan Catalog No. 181-E will interest you.

The Effect of Business on Morals

¶ Doctor Samuel Johnson told Boswell long ago that among no one class of people was there a higher standard of morals than that which existed among the tradesmen of London, and that he had observed how the pursuit of business invariably developed and improved the moral sense and the moral conception of the individual.

¶ Doctor Elliott calls Truth "the new virtue" and Herbert Spencer tells us in his "First Principles" that "experience is the basis of morality." Then, it would seem that morality comes with responsibility, with occupation, with the devotion and application of human energy. Oliver Goldsmith once said, "sickness is a disgrace"—and now we have arrived at a period when we have decided that **idleness is not only a disgrace but a crime** and a very dangerous form of immorality.

¶ Mr. Hubbard, an exponent of our new philosophy of business, says, "We have at last decided to try the truth, as we have already tried everything else and found it didn't work." Have you an opinion as to the reason for the morality which Doctor Johnson tells us existed among the tradesmen of London and among those engaged in the pursuit of business?

¶ Our experience has shown us that it pays to be honest, and not only this but our experience has shown that honesty in business is the only practical policy. The man who sits on the porch of a corner grocery store arguing "corner grocery store philosophy" can afford to guess at the truth and ignore the facts because there is nothing at stake. If his imagination runs away with his reason, it makes no difference, because no one depends on him and there is nothing of importance to what he says or does.

¶ But business is business and no business man can afford to lie for the reason that his reputation as a business man is at stake. He has responsibilities and obligations which must be met; he is in the public eye; his work demands regular hours, sobriety, plenty of sleep and a goodly degree of honest work. These things are necessary to keep the rats out of the basement and the cobwebs out of the garret.

¶ Character and refinement in the highest sense come with responsibility, with hard work, poverty and adversity. From these things have come our great men. These men were and are the products of work, application and adversity, for these are the things that make men strong. And as a further evidence of this fact, the sons of these men who become the leaders of the world are often times the perverts, the degenerates and the idlers who fill our asylums, our hospitals and almshouses.

¶ Business means responsibility—and only the other day a man who stands at the head of the finest organization of its kind in the world remarked that "business is finding good men for good jobs and good jobs for good men." And just here we may add that no man can conduct a big business without constant and continuous concentration—and concentration, you know, is a form of energy which is the result of a clean and wholesome life.

¶ Business demands the best in men, and by continually giving the best, we develop the best and our lives grow into the beauty and honesty of usefulness. Business has done more to civilize the world than all other influences combined. Good business demands intelligent men and women. The young man who enters business has set up a standard of morals to which he is compelled to live if he is to attain any degree of success.

¶ Only the young man who is running on high speed for the "Down and Out Club" can afford to neglect his duties, contract bills which he never intends to pay, hang around the cafes at night, specialize on dance halls and cultivate the poker chip. But not so with the young man who enters the business game.

¶ Doctor Johnson was right. Business tends toward morality.

Efficiency

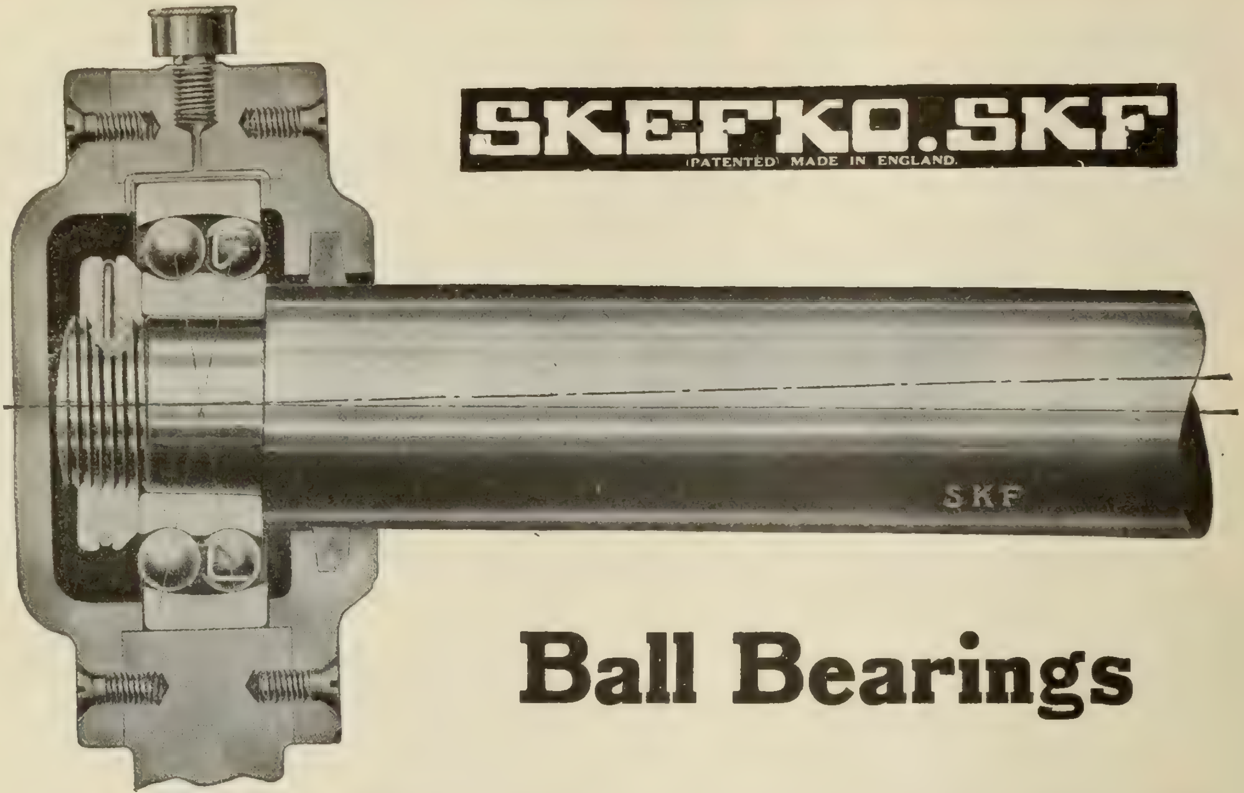
SKEFKO.SKF
(PATENTED) MADE IN ENGLAND.



Ball Bearings

Every feature in a SKEFKO Bearing has been worked down to the closest possible refinement, embodying simplicity, ruggedness, accuracy and the greatest load-carrying capacity. No parts can work loose, rattle or cause bearing failure. The retainer is but one piece of Swedish Lancashire Steel. It performs *right* and is proof against trouble. Moreover, it will not collect grit or other harmful matter.

SKEFKO is the only truly self-aligning bearing. This feature alone is worth most careful consideration.

The outer ball race is machined and ground to a radius struck from the centre of the bearing. The inner race is provided with two grooves, ground slightly larger than the radius of the balls. The balls, cage and inner race, retain precisely the same spacing with reference to each other at all times, and rotate as a unit within the spherical surface of the outer race. The whole constitutes a practically perfect ball and socket joint, capable of adjusting itself instantly and automatically to any spring of the shaft upon which it is mounted. Absolutely no cramping strains can be introduced on the balls, and the permissible arc of deflection covers a range that would instantly destroy a bearing of any other type.

Time and again automatic self-alignment, as obtained exclusively by this construction, has brought success with SKEFKO Bearings where rigid bearings had failed utterly.

SKEFKO Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more and are made in international standard sizes. Their use is practical under any speed and load condition, and the lubrication and protective housing can be made to conform to any service requirements.

SKEFKO are the recognized standard and are replacing other constructions in many types of machinery.

Our literature explains these matters in detail. Your best interests demand that you investigate. Tell us your bearing troubles and ask for our bulletins.

Plant of the Canadian Malleable Iron Co., Owen Sound, Ont.

Staff Article

Malleable iron castings now enter so largely into mechanical engineering construction, that it is not surprising to find steps being taken to provide increased facilities whereby they may be procured conveniently and promptly. Canadian plants for their manufacture are few in number at present; that here described being the latest to go into operation.

THE recently completed plant of the Canadian Malleable Iron Co., Ltd., at Owen Sound, Ont., consists virtually of two buildings, each 80 ft. by 125 ft. Both are of concrete construction, with concrete pilasters 20 ft. apart, reinforced with steel trusses, thereby eliminating the necessity for posts, and giving clear floor space. The side walls of the foundry building stand 21 ft. from the floor level. The buildings are well lighted and ventilated, being provided with abundant window space, and with a monitor overhead. The side walls in the annealing department are 25 ft. from the foundation, while those in the shipping department, which is a continuation of the latter, are 17 ft. high. The roof is of asbestos cement. A Canadian Pacific Railroad siding runs the full length of the plant, and being located on the Georgian Bay, docks are available for bringing in coal and pig iron, as well as for shipping the product.

Plant Lay-out.

Starting at the eastern end of the moulding shop, and proceeding towards the bay, the process of manufacturing may be observed. A large portion of the moulding shop floor is given over to floor work, while on the left, almost the full length of the building, are places for about sixty bench moulders. In the centre of the building, available for both benches and floors, is the malleable iron melting furnace. Proceeding westward from the furnaces, we come to the core department, situated in the left hand corner, and occupying a considerable area. On the right from the core department is the exit, by which an entrance is had to the annealing department. These two buildings connect here by a tramway, along which will run cars conveying the castings from the moulding shop to the annealing ovens.

On entering the annealing department there are first to be noted the hard mills, which consist of four tumbling barrels. The castings are treated in these, prior to being annealed. Half-way down the building on the left are four annealing ovens, ample space being allowed in front of them for the storage of pots, in which the castings are packed. At the other end of the building are the soft mills, which consist of eight tumbling barrels of two sizes. After leaving these mills, the castings are shipped.

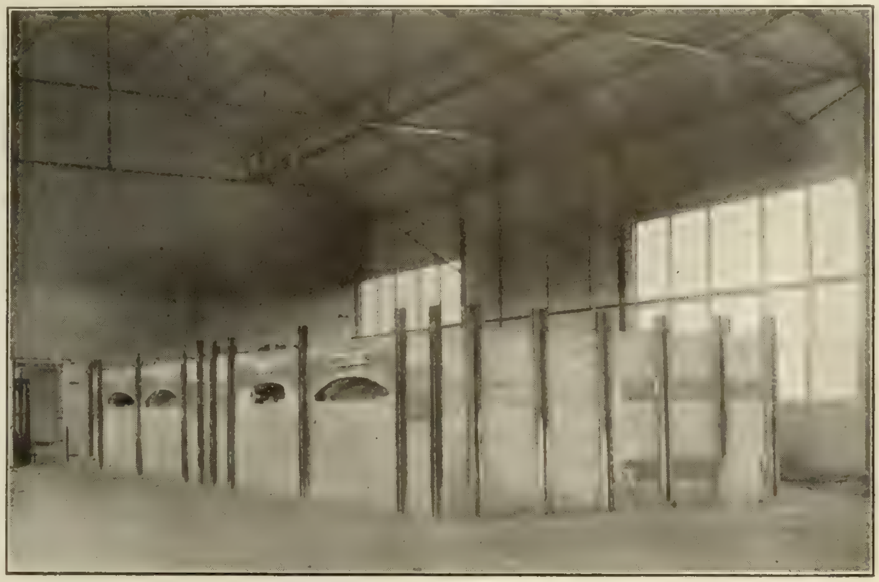

FIG. 3. ANNEALING OVENS.

Furnace Details and Process.

The first operation is to start a fire in the heating chamber, this being allowed to burn for one hour before the blast is put on. After the blast, there is another interval of one hour before the furnace is charged. Above the furnaces will be seen two levers attached to a runway, by means of which two bungs may be lifted from the furnace and moved out of the way. These allow the charge to be inserted. The malleable iron is charged first in the furnace, fol-

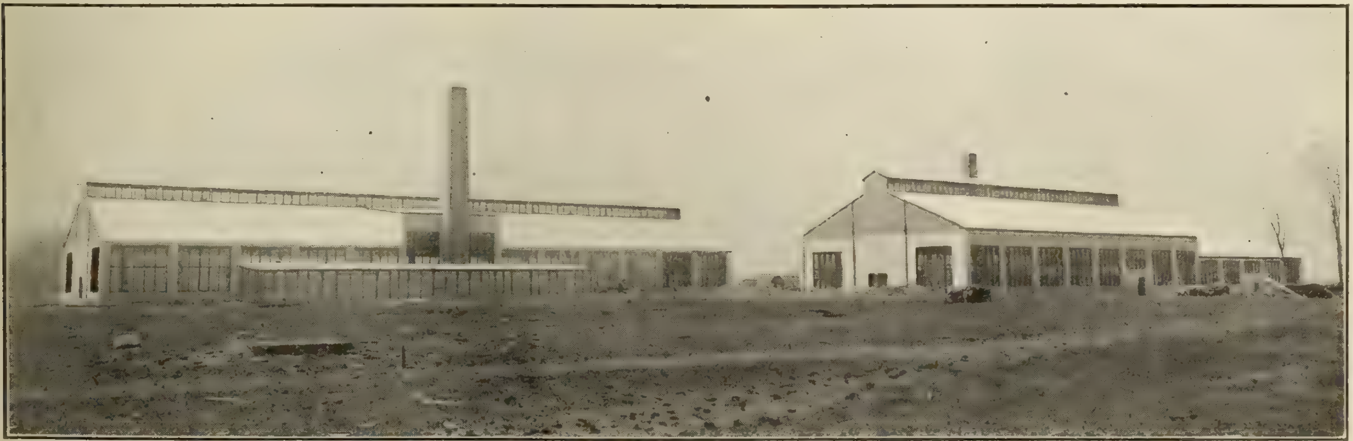

FIG. 1. PLANT OF THE CANADIAN MALLEABLE IRON CO., OWEN SOUND, ONT.

lowed by the steel and sprue, the pig iron being put in last; this is piled up until the beginning of the arch is reached. The two bungs are then placed back in position, and the blast started. After a two hours' run with continuous firing, skimming is started, fuel being added all the time.

A little to the left of the tapping hole seen in the illustration there is a partition of fire brick, which rises to a considerable height, causing the fire, which is drawn through the furnace by blast, to rise, so that it is met by a second blast from a series of pipes above. The fire is thus directed downwards beneath the charge and drawn through the full length of the furnace.

Fifteen minutes after skimming a small ladleful of metal is withdrawn through the skim hole, seen in the illustration, Fig. 2, to the right of the tap hole. This metal, after cooling, is broken, and, from the fracture, the operator can tell exactly how much more heat is required. For pouring, 50 and 100 pound ladles are employed and as the furnace can be tapped from either side, and being in the centre of the building, metal can be quickly transported to the various molds. On the roof of the furnaces an extra set of bungs is kept, in case some of the others give out. Every two weeks a new bottom of silica sand is required in the furnaces, while the bungs, which are made of Beech Creek fire brick, and sealed with fire clay, last about a month.

The stack, 82 ft. high and 8 ft. square, is lined with two courses of fire brick for a height of 20 ft. Draft is supplied by a No. 8 blower, made by the Buffalo Forge Co. Montreal, connected to a 20 h.p. Canadian General Electric induction motor. The blower discharge is 17 inches diameter. The charging space measures 9 x 14 ft., holds 20 tons, and is capable of giving two or three heats per day. The bottom consists of 4 ft. of silicia sand, under which are 18 inches of fire brick over a concrete footing.

The whole space east of the furnace is devoted to floor moulding, there being 30 moulding machines, each capable of 160 moulds a day. On the left, looking west, are 60 moulders' benches.

Core Ovens.

In the left hand corner at the end of this building is the core department, measuring, like the pattern room, 40 ft. square. The core ovens which are of the latest design, were made by the Central Iron Works, Quincy, Ill. There are six trays to each oven, measuring 3 x 6 feet. In each oven the depths of the trays are as follows:—Four of 9 inches, one of 11 inches, and one of 15 inches. On the front of each tray there is cast a clock face with brass finger, by means of which the coremaker can indicate when cores were inserted. An overhead trolley system serves the core ovens, which are fired by coke.

To make their cores, the firm are using core sand supplied by the Hepworth Sand and Products Co., Ltd. Hepworth, Ont. Adjacent to the core ovens are several benches for coremakers, and shelves on which the cores are kept, prior to and after being treated in the oven.

Annealing Process.

After cooling, the castings are taken in large trucks along the tramway into the annealing department. On entering, the truck is stopped at a set of automatic counting scales, made by the National Scale Co., Chicopee Falls, Mass. The castings are then taken to the hard mill consisting, as stated before, of four tumbling barrels. Into these the castings are packed, and revolved for several hours, after which they are prepared for the annealing ovens. The hard mills are run by a 10 h.p. Canadian General Electric motor. There are four annealing ovens, as will be seen by reference to Fig. 3. These were designed by the firm, and can be operated individually, or altogether. The accompanying illustration shows the four doors closed, but not fully sealed. The interior is of Beech Creek 9-inch fire brick, a wedge brick being used for the arch. The ovens are fired from the rear, the fire pit extending beneath, a distance of 8 feet, where it is stopped by a fire brick partition 24 inches high. This causes the fire to pass over the walls of the chamber into the oven and over the castings. It is then drawn through flues in the opposite wall under the floor, passing out to a tunnel and to the smoke stack. The latter is 74 ft. high, and is lined with Beech Creek fire brick.

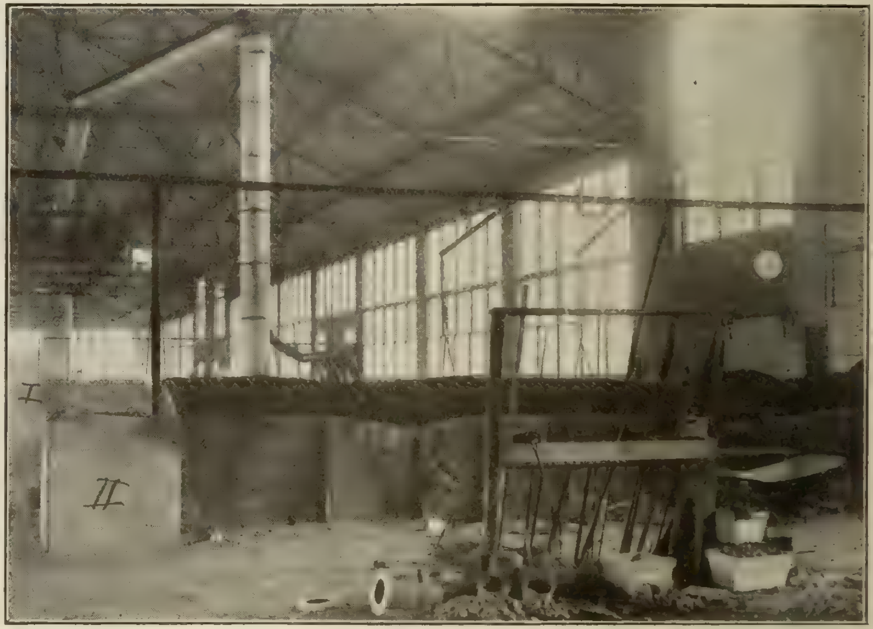

FIG. 2. MELTING FURNACES.

After being treated in the hard mills, the castings are wheeled over to the annealing pots. These have neither top nor bottom, and stand four high on an annealing bottom, which is notched so as to fit a truck, which conveys them into the oven. The castings are packed into these pots with cinders, which keep them intact when the heat has turned them soft.

Each annealing oven measures 16 ft. 2 in. wide, and 23 ft. deep, and has a capacity of 40 tons in 216 pots. The doors are made in two sections of fire brick. They are 9 inches thick, of $4\frac{1}{2}$ x $2\frac{1}{2}$ x 9 inch Louisville fire brick. Each door is provided with two notches at the base, so that it can easily be moved into position by a special truck. In each oven, at the rear, is a peep-hole, by means of which the internal condition can be seen. The practice is to find out through this peep-hole the approximate color which gives the best results, and by noting the temperature recorded by the pyrometer, operate the oven accordingly.

Annealing Takes Three Days.

When castings have been in an oven for three days, the heat is allowed to die off, and the doors opened wide. Three hours are allowed the ovens to cool. Then the pots are dug out and allowed to stand outside for a few hours before being dumped.

The castings after being sorted, are treated in the soft mills. There are eight tumbling barrels in this section, of two sizes, run in parallel sections of four each. These were made by the Central Iron Works, Quincy, Ill., and are thoroughly up-to-date, the chief feature being a renewable sheet metal lining, which prevents the barrel from wearing out. A 20 h.p. Canadian General Electric induction motor drives this section. Each tumbling barrel is connected by sheet iron pipes with a dust arrester, and it might be observed here that the soft mills, previously referred to are also connected with a smaller dust arrester.

Grinding Rosin for Cores.

Quite near to the soft mills is a rosin mill, operated from the same line of shafting. The rosin is used for making cores. The machine consists of a revolving cylindrical sieve of very fine mesh, containing a tank in which is a 10 lb. ball and a dozen metal stars, which, when revolved, break up the rosin into powder. A portion of the tank is on a swivel, and when in a certain position opens and allows the fine rosin to pass out. This was manufactured by the W. W. Sly Mfg. Co., Cleveland, Ohio, and operates at 50 revolutions per minute.

Pattern Shop.

The pattern shop is equipped with a band saw made by the Crescent Machine Co., Leetonia, Ohio; a cross-cutting and ripping saw, with 6-inch pulley, made by the American Saw Mill Machinery Co., Hackettstown, N.J.; an emery wheel and patternmakers' lathe, by the Seneca Falls Mfg. Co., Seneca Falls, N.Y. and a drill press, by Sibley & Ware, South Bend, Ind. Most of this machinery was supplied through the Canadian Fairbanks-Morse Co., Ltd., Toronto.

The Cinder Mill.

Near the annealing ovens is an interesting machine used for recovering iron from slag. It is known as a cinder mill, and is very similar to a tumbling barrel. Inside is a weight, 30 inches long and 8 inches across, having six corners, which smashes the slag into small pieces. A stream of water passes through it as it revolves, and the water carries away the cinders as they are removed from the iron. The latter remains behind at the bottom of the barrel, and when no more cinders issue from the end of the barrel, it is dumped out, and, of course, used again in the furnace. The water, as it issues from the mill, empties into a series of five cement chambers; and after filling the first chamber, passes into the second through a grating, thus preventing any cinders from passing. To reach the third chamber, the water has to pass around the second partition, and to reach the fourth has to pass through another grating, whence it finds its way to a centrifugal pump connected to a 5 h.p. induction motor, which also drives the mill. The same water is used over and over again.

Use City Power.

The power used throughout the building is alternating current supplied by the town of Owen Sound. It comes to the works at a voltage of 2,200, and is stepped down to 550 volts by means of two large oil-cooled transformers situated in a building some distance from the moulding shop. The transformers were supplied by the Canadian General Electric Co. At present there are eight motors in the building, ranging from 5 to 20 h.p.

Inside of a year it is the intention of the firm to make an addition to the moulding shop, equal in size to the present building, which will make a plant in all of 750 feet in length. Another furnace will also be installed.

WORKMEN'S COMPENSATION IN AUSTRALIA.

A SYDNEY despatch says that a contributory workmen's compensation scheme has been introduced into the Victorian Parliament. This provides for joint contributions from the State, employers and workmen to State accident insurance, to be controlled by a Commission which has the power to issue policies to employers. Premiums are as follows:—

For employers, three-sixths; for workpeople, two-sixths, and the State, one-sixth. Payments are to be made at death to persons wholly dependent, of three years' earnings, or $1,000, whichever is the larger. If there are not dependents, then medical and funeral expenses not exceeding $100 are paid; in the case of incapacity a weekly payment of half the average weekly earnings, not exceeding $5 weekly, the total limitation being $2,000. Persons under twenty-one and over sixty are specially provided for.

STEAM TYPE SHOVEL ELECTRICALLY OPERATED.

STEAM shovels are now common enough in countries where labor is costly, but a case has recently occurred where, in addition, fuel is scarce and water power abundant. This is in forming an earthen irrigation dam in Nevada. According to the Journal of the Royal Society of Arts, the shovel used is similar to that of the ordinary Bucyrus type. The power is supplied by electric motors through single-phase mains. The pressure is transformed down from 2300 to 440 volts. The primary side of the transformers on the shovel is connected to the 2300-volt distributary system by 700 ft. of triple conductor. 2300-volt, cable, which is dragged along to suit the locality of the work.

A special hydro-electric power plant was erected, the magnitude of the work to be done justifying this expenditure. The hoisting machinery is geared to a 115 horse-power, 440-volt, three-phase, 60-cycle variable-speed induction motor, having a full load speed of 680 revolutions per minute, the gear ratio from motor to drum being 15 to 1. The propelling of the car is effected by the hoist motor. The swinging and thrust mechanisms are somewhat similar to that of the hoisting machinery.

PRESERVING THE POLISH OF TOOLS.

By J. Crow Taylor.

CONDENSATION of moisture on the surface is what takes the polish off tools and makes iron rust. Preventing it is simply a matter of keeping the surface coated with some varnish, resinous or oil substance. If tools are carefully cleaned every night, and then gone over with an oily rag, they should keep in very good shape; that is, if they are in use every day so that the oily coating has a frequent renewing. A heavier coating for tools that are to be put away for some time, and one that can be cleaned off readily, can be made by melting together 7 parts of tallow and 1 of resin, stirring the same till it cools. Apply in a half liquid state, thinning to the right consistency with either benzine, gasoline or coal oil.

TEMPERATURE OF TURBO-ALTERNATOR APPARATUS.

THE temperatures actually obtainable are liable to be materially higher than the usual methods of measurement will indicate. A rough measure can be obtained by exploring coils or thermocouples, but it is evident that such coils, if placed next to the copper, will not give the correct temperature measurement if the flow of heat is from the iron to the copper, while a coil next to the iron will not give the correct result with the flow from the copper to the iron. The manufacturer, with his guarantee of 40 degrees C. by thermometer, actually builds for possible temperatures of 70 degrees to 90 degrees C. in some parts of the machine, for he expects to find fairly high temperatures in some cases with exploring devices. The usual guarantee of 40 degrees C., therefore, should be considered as only a relative indication of a safe temperature in such apparatus.

W. Chase Thomson has opened an office in the new Birks Building, Montreal, where he will act as consulting engineer, making a specialty of bridges and other steel structures.

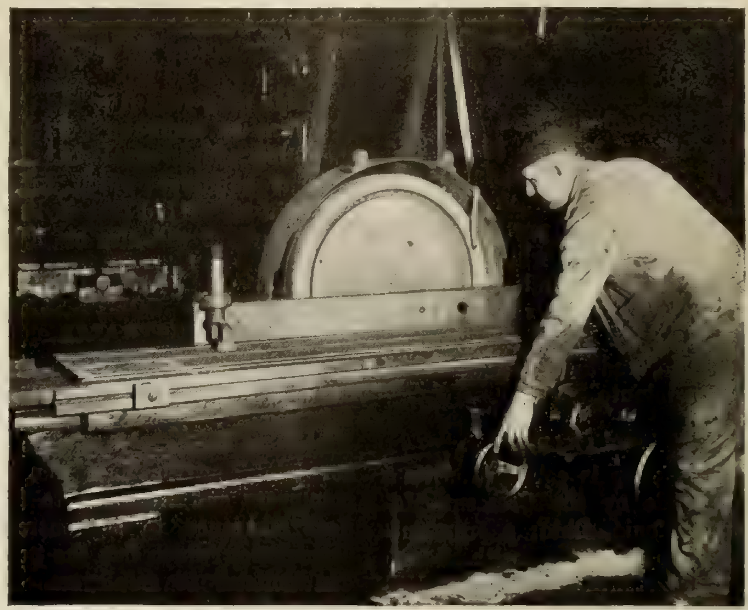
The Grinding Feature in Railroad Shop Equipments

Describing how Guide Bars, Links, Pistón Rods and Car Wheels are ground, also the methods used in grinding valves and air brake connections.

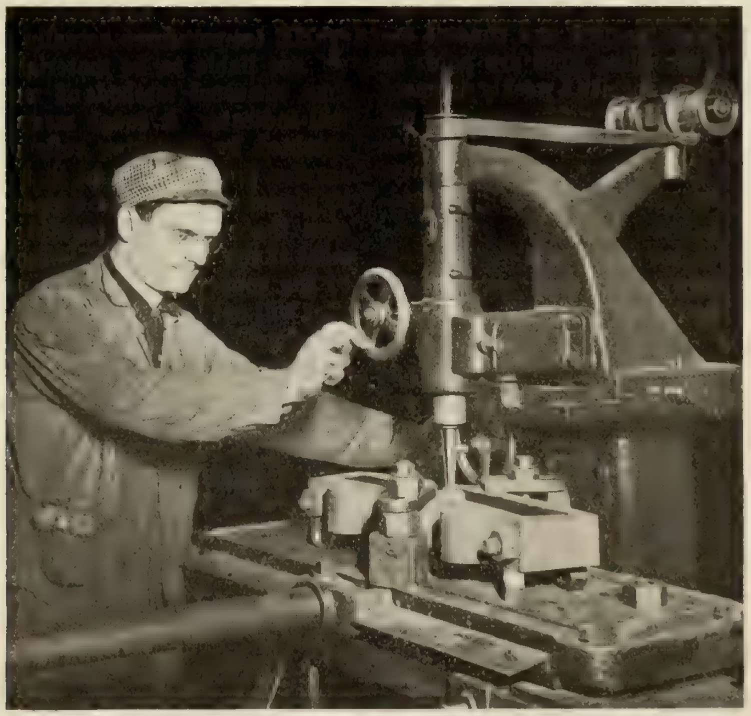
SEATED on plush or velour-covered seats in a railway coach, speeding across country at a rate of from fifty to sixty miles an hour, and gazing out upon an ever-changing panorama, the casual traveler rarely takes into consideration the tremendous energy which is expended to make possible such luxurious travel. Very little thought is given to the railroad shop, where almost every piece of equipment which goes to make up a modern railroad train is produced with a view towards increased comfort and efficiency.

To such, a visit to one of these hives of industry is, indeed, a revelation. Almost every trade is represented, and as one is piloted through the various departments he experiences a feeling of bewilderment at the seeming confusion which appears on all sides. Yet there is, probably, no other place where better system is observed than in a railroad shop. If you are interested in grinding, your attention is immediately arrested in the grinding room, to which place every piece of equipment which has to be ground is sent, and not only the equipment but the tools used in producing that equipment are ground here.

The actual grinding operations in a railroad shop are similar to those encountered in other industrial shops, with the exception of guide bar, link, piston-rod and car-wheel grinding, so in this article we will describe these operations in order.



GRINDING A GUIDE BAR ON THE BRIDGEPORT GRINDER.



GRINDING A LINK ON A HAMMET RADIAL GRINDER.

Grinding Guide Bars.

Guide-bar grinding is one of the hardest grinding problems of the railroad shop. As most of our readers are aware, the guide bars are the parts that steady and guide the crossheads in their reciprocating motions. They are fastened to the cylinder heads at one end and to the guide yoke at the other end. As the cylinders and the guide yoke are fastened securely to the main frame of the locomotive, it will be seen that the guide bars are securely supported. This is essential, as there is great strain put on the guide bars by the action of the main rods when they are at their highest and lowest points.

Guide bars are usually made of 40-point carbon steel, and generally case-hardened, for the smaller types of locomotives. Most master mechanics do not consider it good practice to case-harden large guide bars, therefore, the guide bars on large types of locomotives are left soft. It is obvious, however, that a case-hardened guide will outlast one that is left soft.

Grinding does not enter into the manufacture of new guide bars, as they are finished to size on a planer, several guides being planed in one operation. The planer is equipped with two heads on its cross rail, one head doing the roughing, while the other takes the finishing chip. It is after a locomotive is brought off the road into the shop to be overhauled, that the guide bars need the grinder's attention, the grinding operation being to straighten up the surfaces.

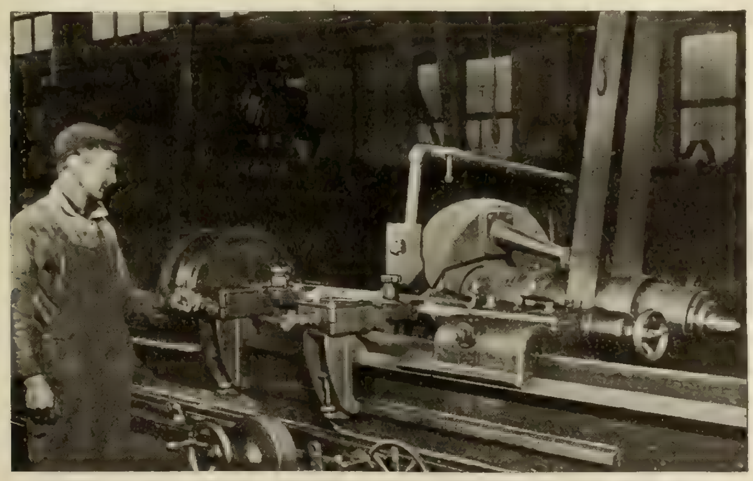
Usually, they are worn from one-sixteenth to one-eighth of an inch out of true, the wear for the most part being in the centre. The grinding is done on special machines, the best-known types of which are simple in construction and easy to operate. The guide bar is strapped to a platen on the bed of the machine, and travels back and forth past the face of the grinding wheel. After each traverse of the work past the grinding wheel, it is fed in slightly. The guide bars are ground on two sides and the face, although, in some shops grinding of the sides is not being done as much as formerly.

A Good Grinding Wheel Essential.

While the actual process of grinding guide bars is quite simple, and does not call for special skill on the part of the operator, yet it is most essential to have a grinding wheel which is adapted to the work. Such a wheel must be of the proper grit and grade, and grind fast without too much wear. It has been the custom until recently to grind these guide bars wet; in fact, in many shops they are still doing the work this way, but the disadvantages of this method, with its resulting dirty conditions, has made welcome anything which would make the operation more congenial. Wheels are now available which fulfil all these requirements, and make it possible to do this work just as well dry as it has formerly been done wet. These are of the cup or ring type, 30 inches in diameter, with a two-inch grinding face.

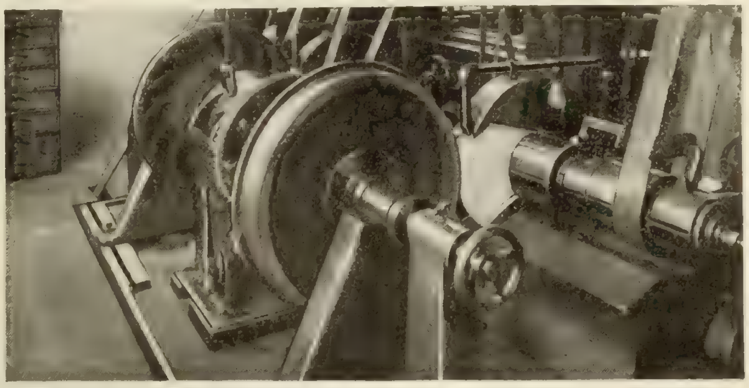
Link Grinding.

Link motion as applied to locomotives consists of a reversing gear in which the valve rod is connected to a block, called the link block, capable of sliding in a slotted bar controlled by a system of levers. There are two types of link in general use—the solid and the two-piece or saddle link. They are both convex towards the eccentric rods, the gear being changed by raising or lowering the radius rod connecting the link with the valve rod.



PISTON ROD BEING GROUND ON A NORTON CAP GRINDER.

The severe strain to which these links are subjected causes them to wear out of true, and they are then sent to the grinding shop to be trued up. This work, like guide-bar grinding, is done on a variety of machines, mostly of the shop-made type. They are, as a rule, built on the pendulum principle, a swinging arm, to which is attached the link, giving the desired radius. The grinding wheel is held in a stationary attachment, the link being applied to its face as the arm swings to and fro. In some shops the links are ground free hand on a large wheel, but where there are a large number to grind this process is slow and tedious.



THE NORTON CAR WHEEL GRINDER.

Of link-grinding machines in use, the Hammet radial grinder has so far been found to be the most effective. In fact, we are given to understand that it is the only machine on the market, the others being of the shop-made types. From the accompanying illustration, a general idea of the construction of this machine and its operation may be gained. As in almost every class of grinding, a grinding machine is no better than its grinding wheel, and in link grinding it is essential in order to insure good results, to have the very best wheel obtainable for this work.

The links are made of wrought iron, case hardened, being ground on the sides and on the inside, the amount of stock to be removed varying according to their condition. Where there is 1-32nd of an inch stock to be removed, a link can be ground to a good finish in an hour's time.

The wheels which give the best results on the Hammet grinder are from 1 to 4 inches in diameter, and from ¾-inch to 4 inches thick. The wheel speed is 3,328 r.p.m. These wheels are also used on machines of the shop-made type, and the same good results are obtained. In some railroad shops it is customary to place several links together on a spindle and grind them in one operation. Where such a method obtains the operators do not work under piece-work conditions, and no particular time is set for grinding a link or any number of links.

Grinding Piston Rods.

The operation of piston rod grinding is purely a straight cylindrical grinding proposition, into which very little precision work enters. As on guide bars, the greatest wear on piston rods is in the middle, and the work consists of truing the ends down to the diameter of the worn section at the centre. These rods are made of forty-point soft steel, and in grinding them it needs a wheel which will cut clean and fast and will not burn.

A popular machine for grinding piston rods is that which allows the piston rod to be ground without removing the piston head. The part of the rod which has to be ground is 3½ feet long and 3½ inches in diameter, the tapered ends which carry the journals being turned. The wear on these pistons—that is, the amount which has to be ground off, runs anywhere from .015 to 1-16 of an inch, and in some cases it is necessary to grind off at least ⅛ of an inch of stock before the rod is once more true. Before going on the engine, the rod must have a perfectly smooth finish.

Wheels 18 to 24-inch diameter, are used in this service.

Chilled Car Wheel Grinding.

Years ago, when the chilled wheel was in general use on passenger cars, and when the mileage guarantee was much lower than at the present time, the grinding of chilled car wheels was a much more important problem for the railroad shop than at the present day, when the steel car wheel has very largely displaced the chilled wheel in passenger service. The improvement in the manufacture of chilled car wheels both in uniformity of chill and depth of chill, thus increasing the mileage guarantee per car wheel, has caused railroad shops to be relieved of much of the grinding.

A number of important railroad systems in the United States manufacture their own chilled wheels, and where such chilled wheels are of the plain type, very little grinding is needed, unless a standard of size is required. Chilled wheels made by the contracting chill are ribbed across the tread of the wheel in the shape of narrow fins of the metal, which have flown between the contracting plates in molding. These hibs or fins must be ground off, and the tread brought to a smooth, even surface. In this type of wheel considerable grinding is necessary.

Carborundum wheels have been eminently successful in practically all shops where chilled car wheels are ground. One shop in particular, which keeps very accurate records of the cost of grinding car wheels, shows an average cost of less than one cent per car wheel, which speaks for the qualities of carborundum in this type of grinding.

Chilled car wheels, after they have been in service for some time, develop what is known as flat spots. These spots are caused by the wheels skidding on the rails, and, in continued service, the flat spots increase in size by the constant pounding and repeated skidding, until the flat spots are sometimes fully 5-16 of an inch in depth below the circumference of the wheel, and practically the full width of the tread. To secure a reasonable mileage for such wheels, and also to eliminate the wear and tear on the rails, it is necessary to grind the flat spots by reducing the entire circumference of the car wheel tread to the lowest portion of the flat spot. In some shops this work is done by removing the wheel from the axle and regrinding the wheel.

Valves and Air Brake Connections.

To any one but an engineer, a brake valve is a complicated piece of machinery. It is a part of the equipment of a locomotive which requires constant attention, the safety of hundreds of passengers often depending upon its efficient service. After a certain time, the parts of these valves become pitted and worn out of true, and they are then sent to the grinding room to be put in good repair. If the pits are not too deep, this work is very easily done. There are two parts which have to be ground, the valve stem or plug, and the body or seat, into which the stem fits. The valve stems are ground on a steel face plate having a groove down the centre, into which the stem fits. Over the face of the groove, a thin paste, consisting of carborundum grains mixed with oil, or the prepared carborundum valve-grinding compound, is laid. The operator then takes one of the valve plugs and a few rubs up and down the groove is usually sufficient to remove the pits and bring it to true, and it takes only about three minutes to grind one of these plugs. Formerly it was the practice in many shops to use ground glass or emery as the abrasive, but now these materials are very rarely used.

Carborundum grain is almost exclusively used for grinding out the bodies and seats, a special machine being used for this operation. This machine is simple in construction and consists of two perpendicular spindles to each of which is attached a brass valve. Under the table of the machine there is a revolving horizontal spindle to which is attached an eccentric wheel having two knockers . As the wheel revolves, the knockers force the pins up and down. The bodies are placed on the valves, and a paste of oil and carborundum grain added. It then takes but a short time to grind the bodies out evenly and to a fine finish. The grinding time varies from five to fifteen minutes, according to how much the bodies are worn. Angle cocks, blow-out cocks, and equalizing valves for air brake connections are ground in the same manner. In size these run from one-half inch up to one inch an a quarter, and it is possible for an operator to turn out 250 a day on one machine.

The other classes of grinding found in a railroad shop are those of general work, snagging castings, and tool grinding. The latter includes drill, cutter, and reamer, die and small grinding, and is much similar to any other tool-grinding shop. The range of work is large and necessarily there must be a large range of grinding wheels to do the work.

We are indebted to the Carborundum Co., Niagara Falls, N.Y., for the illustrations accompanying this article.

* * *

BALL AND ROLLER BEARING MANUFACTURE.

PROBABLY very few persons are aware of the extreme accuracy that is essential in the manufacture of ball and roller bearings. Obviously, however, where millions of balls and rollers are turned out, it is practically impossible to have the limit of error in every one of them exactly the same, despite its desirability. To obviate trouble resulting from such inaccuracy, a new machine has been put into use in the United States.

The rollers are fed on to a rotating steel disc, and passed in turn in front of delicate plungers arranged around the periphery of the disc; these plungers are in fact super-sensitive gauges capable of detecting differences of one-quarter of a ten-thousandth of an inch. When a roller touches a plunger, electrical contact is made, and the mechanism then drops the roller into a canister. The next roller may not touch a gauge until it has made almost the complete circuit, but it must touch one of them, and thus find its way into one of the receptacles. In making up the assembled bearings, all the rollers in any bearing must come from the same canister. thus insuring that all of them are as nearly the same size as human ingenuity can make them.

* * *

CANADA'S MANUFACTURING ENTERPRISE.

THAT Canada's manufacturing enterprise compares favorably with that of the United States is well indicated by the following figures. With a population of one-twelfth that of the United States, Canada had 19,218 establishments in 1910, compared with a total of 268,491 across the line in 1909. Ours were capitalized at 1¼ billion dollars; those of the United States 18½ billion. Our wages amounted to $197,000,000 against 3½ billion over there. Our products were nearly 1¼ billion, compared with 20½ billion. Our materials were worth $601,509,000 against nearly 12¼ billion in United States. Thus, our heavy borrowings and adverse trade balance are accounted for by our commercial activity.

* * *

UNUSUAL CRANE ACCIDENT.

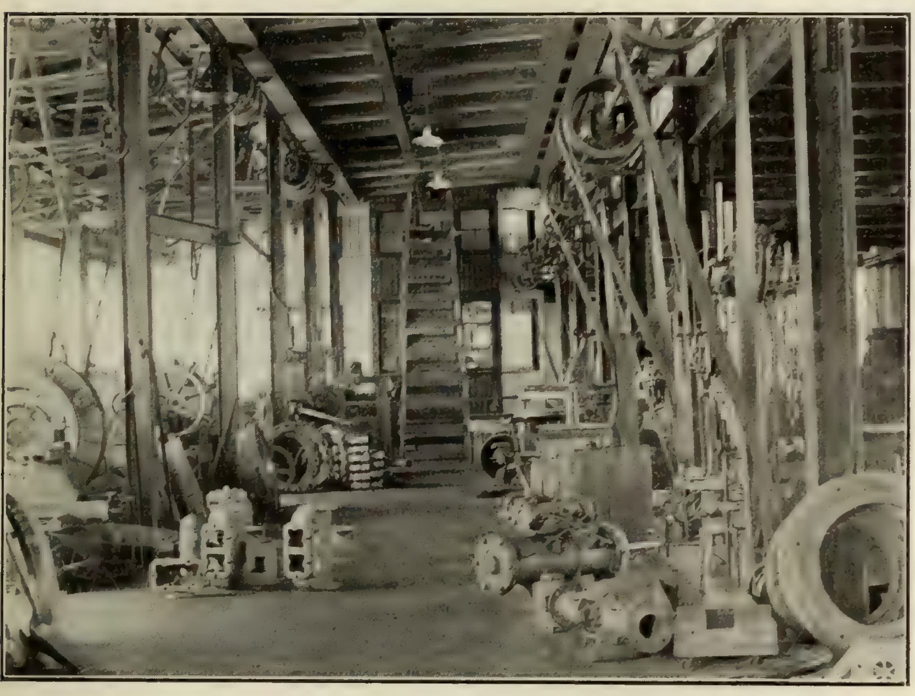
THE Vulcan gives particulars of a crane accident of an unusual character. It appears that during the working of the crane, the bearings became loose, and one of the rollers flew out, striking a workman on the back of the head with fatal results. At the inquest it was explained that it was a most unusual occurrence for the bearings of a crane to become loose. The displacement of the bearings must have been caused either by the rollers becoming twisted or by some grit which had got in and set up friction which lifted up the ring holding the rollers in position. It would be possible to prevent a recurrence by fixing a guard on the top of the ring.

Plant and Product of the Bawden Machine Co. Ltd., Toronto

This young, but progressive and enterprising concern are now not only in possession of their new shops, but have for some time had them in full and successful operation. Inspection of their plant, equipment and specialties manufactured, and relative to which this article is a racy account, warrant the prophecy that projected additions and extensions will be near future necessities, in order to cope with the increased business now offering.

BAWDEN MACHINE CO., LTD.

THE Bawden Machine Co., Ltd., was established in Toronto over seven years ago by Mr. Fred. W. Bawden, as a general machine shop. The business has grown steadily, new specialties being introduced from time to time, and the latest of these being the "Bawden" steam pump. Such success was attained in marketing this pump that a move to more commodious premises became necessary. Two years ago the company was re-organized, and a site secured in West Toronto, on which an up-to-date factory has been erected, the location being between Sterling Road and the G.T.R. tracks.



INTERIOR OF MACHINE SHOP—III.

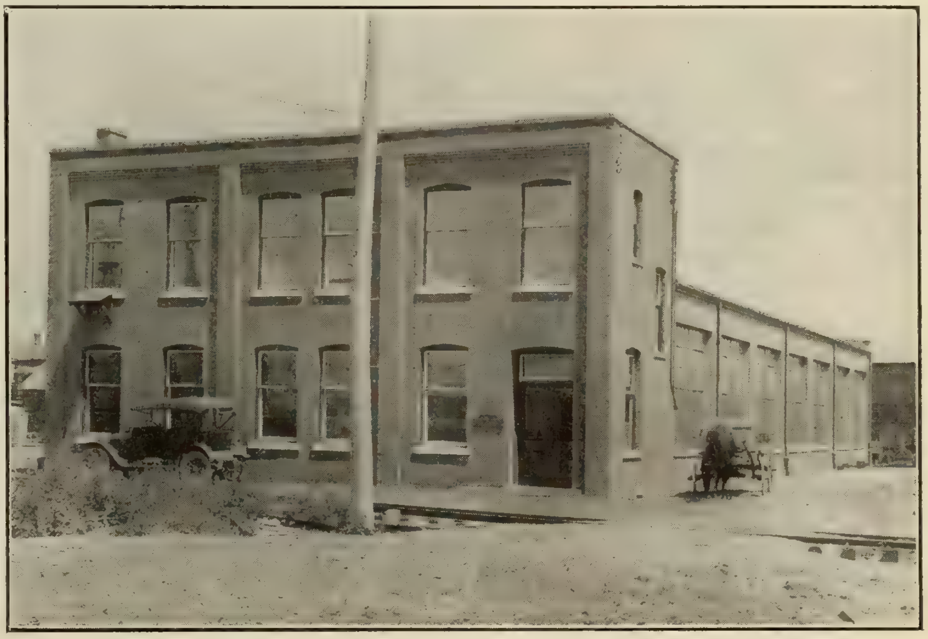
Lay-out of Plant.

At present the factory consists of a rectangular brick building 126 ft. long by 50 feet wide, the front part being devoted to general and private offices, with drawing office above. Adjoining the offices, and extending the full length of the building is the machine shop, which is 50 feet wide and about 108 feet long. Above this shop, extending the full length and about 20 feet wide, is a mezzanine floor or gallery, used as a brass finishers' shop. On the north side leading from the machine shop are the tool room, work room, boiler room and blacksmith's shop. The testing room is adjoining the boiler room. At the east end of the site is the pattern storage, 35 ft. by 15 feet, while further along is the pattern shop 50 ft. by 30 ft. The latter is at present isolated, but it is proposed to build an iron foundry between the pattern and machine shops, which, when completed will allow for a continuous movement of work in one direction, handling of work being thereby reduced to a minimum. An assembling department is also contemplated; this will be located near the foundry and machine shop. As the "Bawden" pump is the chief line manufactured, a special building is to be erected on the south side of the machine shop, which will be devoted entirely to the manufacture of pumps.

Machine Shop.

The machine shop is well laid out, the machine tools being arranged so that there is plenty of room for the work to be handled; waste space being a minimum. The lighting is good, the windows being large, and fitted with steel sash and wired opaque glass. The machines are driven from three lines of shafting operated by motors using Hydro-Electric power. Benches for the fitters are placed along one wall running the full length of the shop. The tool room is kept in an up-to-date orderly manner, nothing being given out without a signed order. The shop is steam heated by coils located along the walls, the source being a Jenckes Machine Co. boiler.

There are several interesting tools installed, the principal being a "universal" horizontal boring machine by the



EXTERIOR OF BAWDEN MACHINE CO. PLANT.

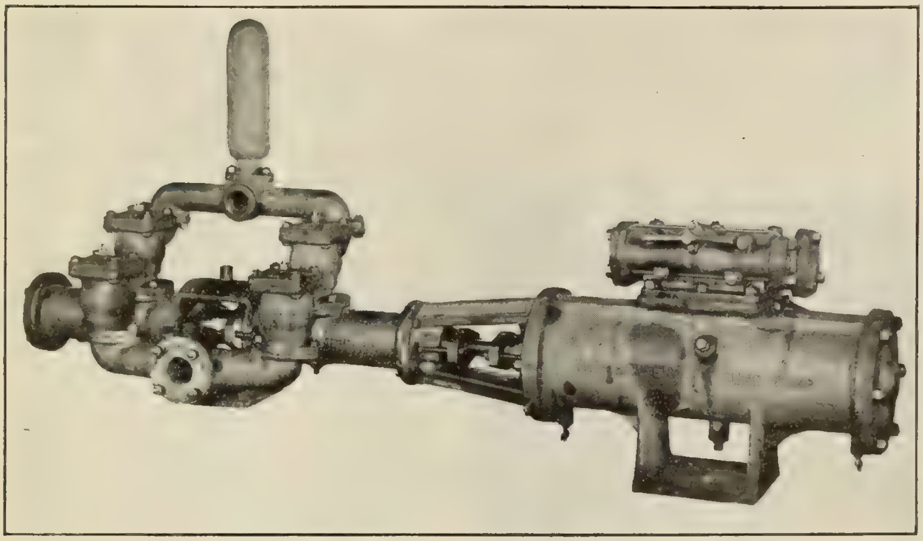
Universal Boring Machine Co., Hudson, Mass., a machine capable of handling many varieties of work. A No. 3 high speed drill by Baker Bros., Toledo, Ohio, and a 42-in. lathe by the Bradford Machine Tool Co., Cincinnati, Ohio, are located on the south side of the shop. On the north side are to be found a 36-inch vertical boring machine with turret tool head, made by the Gisholt Machine Co., Madison, Wis.; a No. 3 universal milling machine by the Beeke-Brainard Milling Machine Co., Hyde Park, Mass., which is used entirely for milling the tire treads on the inside of the outer mould referred to later; a 36-in. Le Blond heavy duty turret lathe; three 20-in., 14-in., and 7½-in. high speed screw cutting lathes by F. G. Reed & Co., Worcester, Mass.; a 16 ft. planer by the Whitcomb, Blaisdell Co., Worcester, Mass., and two 60 in. and 42 in. triple geared lathes by the New Haven Machine Co., New Haven, Conn.

General.

The machine shop is lighted by 100 Watt "Mazda" tungsten lamps arranged in rows along the aisles and walls overhead. In the other departments, including the offices, 60 Watt lamps are installed. The lamps were supplied and installed by the Rooke-Windler Co., Toronto.

When the additional buildings are erected, industrial tracks will be laid down between the various shops to facilitate the handling of work. At present hoists are suspended from an overhead runway extending the full length of the machine shop. There are also two jib cranes attached to columns, for handling heavy work. About 65 men are on the payroll at the present time, but this number will be increased considerably when the proposed shops are in operation. A wash room for the convenience of the men adjoins the machine shop, in which two rows of cast iron enamelled lavatories have been installed, in addition to other fittings, enabling the men to get cleaned up before leaving for their homes.

The factory being located near the railway, a spur has been laid from the G. T. R. tracks along the front of the building, thereby greatly facilitating the handling and despatch of shipments.



"BAWDEN" COMPOUND STEAM PUMP.

The "Bawden" Pump.

The "Bawden" pump was designed and patented by Mr. W. Atwood, chief draftsman for the company. The design embodies several interesting features which have given very satisfactory results. It is of the simplex type, the steam cylinders being either single or compound. The pump is governed by two piston valves which are controlled by the action of live steam only. Such gear as tappets, levers, springs and rock shafts have been dispensed with. A special feature of the piston valves is the arrangement for catching leakage of steam due to wear and tear.

The steam piston is automatically cushioned at each end of the cylinder by the special design of the two main steam ports, dispensing with all adjusting mechanism. There are no dead centres, and there is no tendency to hang up. It will run under full load at the fastest and lowest speeds, thus providing a flexible pump for all purposes. The single steam cylinder pump has packed water pistons, brass liners and outside valve boxes.

The compound steam pump, shown in the illustration, embodies the same valve features as the single unit, and where greater economy of steam is desired, this type is to be recommended. It has brass liners, and centre packed working barrels, easily accessible as may be noted. The high and low pressure pistons work in one cylinder, the steam and exhaust ports being of the shortest possible length, and so arranged that the high pressure steam passes direct to the low pressure cylinder without the medium of external passages; condensation is thereby reduced to a minimum.

A recent test of a 5-9-4 x 10-inch, compound outside packed pot valve boiler feed pump, for 250 lbs. pressure, gave very satisfactory results. The pump started on 8 lbs. of steam and with 40 lbs. of steam gave 160 lbs. pressure on the water end. There was a steady

INTERIOR O FMACHINE SHOP.—I.

flow of water at all pressures, and the pump made a steady even stroke, there being practically no vibration. The pump was also run as slow as 2 to 3 feet per minute, and made the same even full stroke.

Automobile Tire Molds.

Another interesting line manufactured by the Bawden Co., is the moulds for making the covers of automobile tires. The inner mould or core is of cast iron, and is made to form the inside part of the cover, while the outer mould is made in four sections, each being divided down the centre and bolted together. The inside part is milled to suit the tread of the tire to be made from it. The core and outer mould are held together by two circular cast iron rings, one on each side, forming the side of the tire. All sections are securely bolted together when the rubber compound is being poured.

A motor-driven reciprocating pump is at present being developed, while toolmakers' dies and general engineering work form not unimportant additional fields of enterprise. Fred W. Bawden is manager; H. A. Harrison, sales manager; W. Lawson, superintendent, and W. Attwood, chief draftsman.

* * *

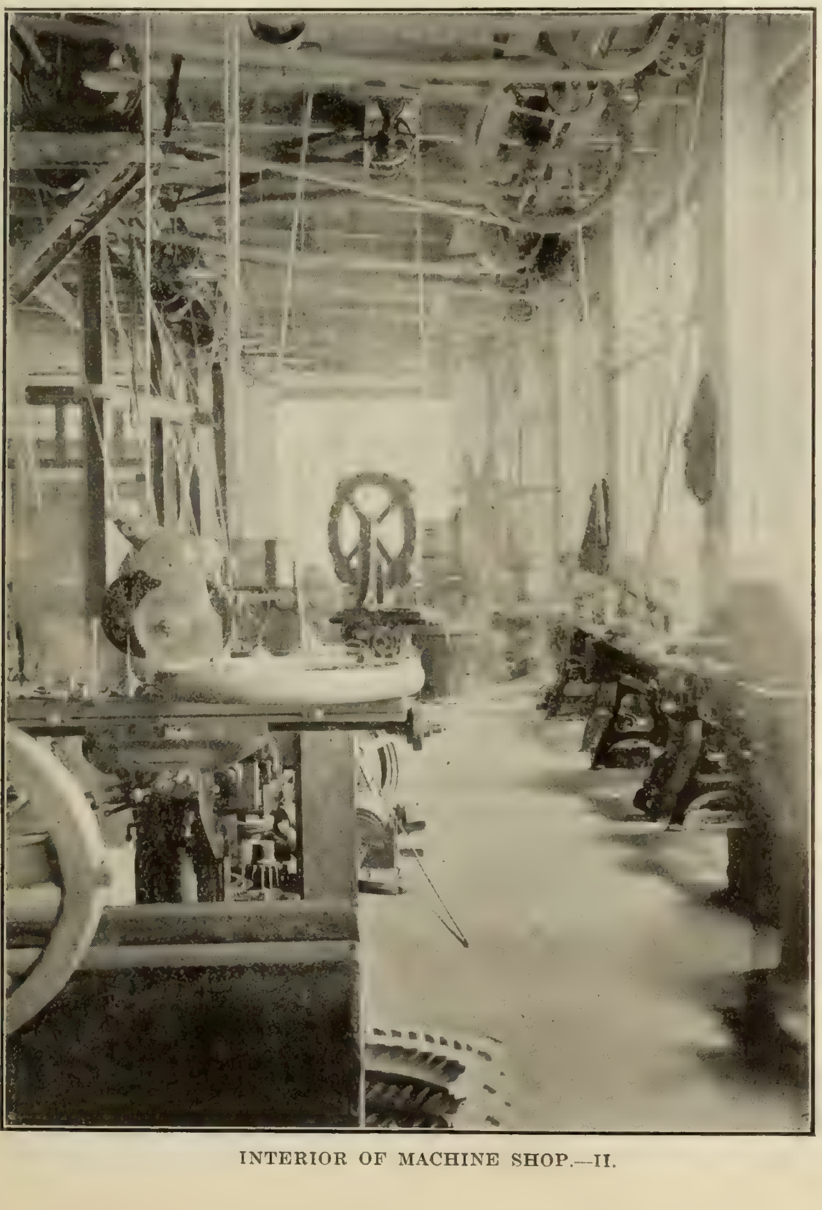
THE LIFE OF A MACHINE TOOL.

J. D. SMITH, writing in the "Machine Tool Engineer," says:—There are numerous points from which the life of a machine tool may be considered, and it would be wrong practice, especially from an economical standpoint, to lay down hard-and-fast rules with regard to the life of any tool, assuming, of course, that the rules laid down were to apply to machine tools no matter where they may be.

Features to be Accounted.

Machine tools may be subjected to entirely different conditions, and the same rules laid down for the "scrapping" time of those in a large and up-to-date works, where capital is plentiful, would certainly not be allowed in a private firm where the capital is limited. There always comes a time in the life of them when the advisability of putting them out of commission is discussed by both the foreman and the management. Usually this occurs when there is a heavy run of orders, and the machine is piled up with work.

In some cases, although these are getting more rare every year, there is no machine on the market which will do the job in less time than the old one, especially if the machine has been specially designed for a certain operation; so it is desirable from every standpoint to take into consideration the possibility of obtaining repeat orders of the work in hand before another machine is put down, or whether the present rush is only temporary and due to causes in other departments, which by judicious measures can be avoided in the future.



INTERIOR OF MACHINE SHOP.—II.

The Product Delivery.

I have found that the question of "scrapping" old machines and replacing them with new ones is never brought more prominently to the notice of the management than when the output is not up to the promised dates of delivery of the office. When the orders are normal and the plant is quite able to fulfill them to the time promised, nobody seems to bother, and the management do not see the necessity of more outlay, especially if every machine is in working order, and able to do the particular part required of it.

This policy is wrong if there is capital available. The slack time should be used to its full advantage, inquiries made from the various makers of the particular machines desired, and machines installed to replace those which by their age stand at a very low valuation. Such a policy has at least three advantages to justify its adoption.

First, the new machines stand at their full value in the balance-sheet for a year at least, and, therefore, show no loss, the extra work gained by their installation being actual profit.

Secondly, they are there ready when the rush does come, as it will eventually, when trade revives, apart from the fact of their being able to turn out more work than the old ones, thereby reducing the cost, which helps to justify the expenditure.

Thirdly—and not the least advantage, in all probabliity, it is possible to get the machines at a slightly reduced cost from the makers, as, when the manufacturing trade is slack, the machine tool makers are usually likewise situated, quick delivery is obtained, and the installing of the machines can be done without extra wages for overtime, this being a considerable item during a busy period, weekends being worked in many cases, when the actual labor cost is doubled.

Installing New Machines.

The first consideration when installing new machines should be the return for the outlay. It may be that the new machine will not produce any more work than the old one in the same time, but it must be remembered that the work done will be more accurate and nearer to standard, and although the cost is the same for machining, it will be reduced in the fitting, as less time will be spent in bringing the articles to the correct sizes.

Then, there is the machine which is guaranteed by the makers to turn out a larger quantity than the old one, in the same time. The advantage gained in more accurate production, this being felt mostly in repetition work, providing the inspection has been thorough before it is taken over by the purchasers and the specification fulfilled.

When framing specifications for new machines, due regard should be had to the handiness of the different operations. From the operator's point of view, the handier it is, the more conducive to economy. Fixtures for holding work, etc., should be as plain as possible for the results desired, as in many cases, especially on recent machines, the actual cutting time is less than the time taken in preparation, therefore the preparation time should be cut down as fine as possible by handy fixtures, etc., so as to get the fullest cutting time on the machines per day.

The Art of Improvisation a Valuable Factory Asset

By J. T. Towlson

We are afraid that less opportunity exists now than formerly for the display of that genius which asserts itself in an emergency, and pulls the "fat from the fire," as it were, without burnt fingers. In all factories, large and small, irrespective of equipment installed, occasion presents itself, however, and a pleasing feature is that, whether the employees are numbered by tens or by thousands, a genius on improvisation is available to meet it.

IN a general engineering shop, and more especially in the machine-tool section, a mechanic who is able to spontaneously improvise is an asset of no little value. It is a faculty, or an art which cannot be taught or learned from any kind of text book, and is akin to genius. Moreover, men who possess it, without parade of the fact, give unmistakable evidence of its possession, on every possible occasion; while others—the great majority, me-thinks make great parade of their utter disinclination to even endeavor to get through any piece of work—difficult or otherwise, unless every tool—every appliance and all the recognized and orthodox means are provided for them.

A man who can "make things do," and "who can scheme a rig-up," on the spot, is a jewel, and one whom a shop-superintendent appraises at his correct value. Some of us have experienced untellable discomfort at the antics which some men display, when requested to put a particular job through smartly—a break-down in a factory, for instance. They cherish a certain code of "honor," which prevents them rushing a job through—and will be so chary of beginning smartly as to want this and want the other thing ere they can begin.

We also have pleasant experiences of other, but essentially dissimilar, men, who all but anticipate their foreman's wishes—and are on the job, with a rig-up concocted, and are sailing away towards a finish in double-quick time.

The men "who cannot scheme," and who have not the faculty of improvisation, I am rather sorry for, and cannot give them any help; but I should urge the unwilling ones—when a job is really and honestly urgent—to get hold of the fact that it is more honorable, and a more durable satisfaction to push it along with all reasonable speed, than it is to hang hulking about ere a start is made.

"Anything Will Do" — "Nothing Won't."

"Anything will do;" "Nothing won't," is a phrase I have heard many times from the mouth of a genius in improvisation, whether he was making a drawing, launching a vessel, loading a boiler, or getting a locomotive engine back on to the rails.

The first and nearest thing at hand was made to serve in a case of emergency; it may not have been the precisely correct thing for the purpose taken by itself, but, coupled and used with the genius' intelligence, it served its purpose supremely well on every occasion.

Practical Example I.

I saw him once in a goods' yard of a railway station, with a couple of large Galloway boilers to unload from trucks, on to the ground. He had no tackle of any account—only a good rope and a few 3 in. planks. He laid the planks—one end on the edge of the truck, the other end on the ground; and, as he was preparing to roll the boilers towards the planks, he was warned that the planks would break. "I expect they will," he replied, but as he had laid a quantity of sacks, filled with ashes and straw, just under the spot where he knew the planks would break, he just

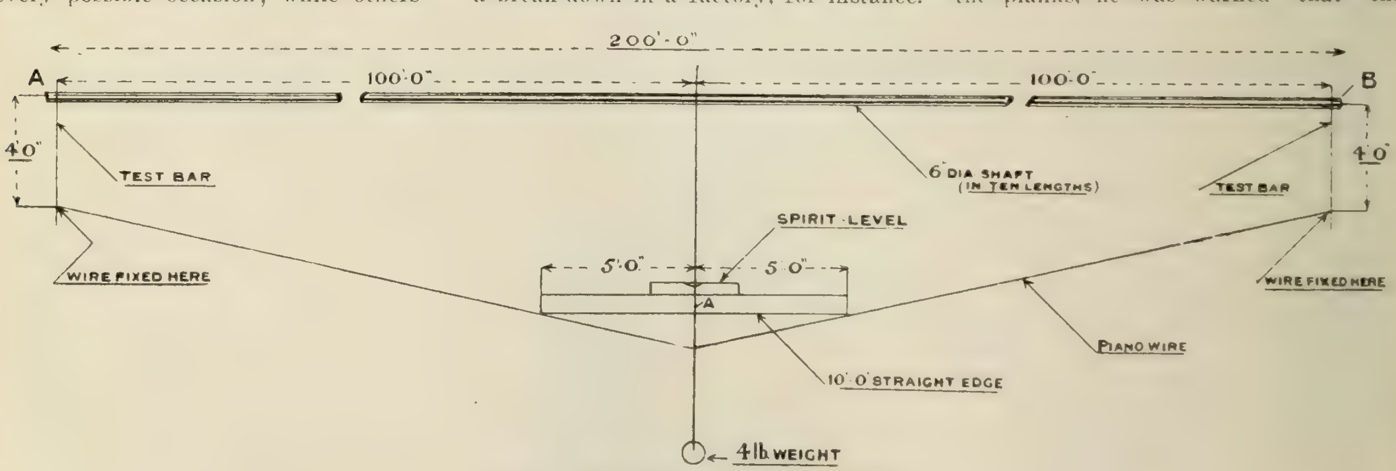


FIG. 1. THE ART OF IMPROVISATION.

parbuckled the rope round the boilers, took two turns round the stop-valve base, and told us to pull away. This we did, and the boiler rolled off, smashed the old planks and fell on to the filled bags, as on to a cushion. Methinks, equal genius was here evinced, as if he had taken hours to design it, but it was was spontaneous.

Practical Example II.

Another case: The line shafting of a large machine-shop gave evidence of being out of true, and out of level also—too much power being absorbed in overcoming the abnormal friction of its running details. He had the job to test it, and give a report. The management anticipated a big and arduous job, accompanied by considerable overtime; as no one considered it possible to make tests of this nature, while the shaft was running; but this genius of an improvisator was quite equal to getting readings of the out-of-level of the shafting in quick time, and that when the shaft was running. He recognized the fact that records should be taken when the shaft was running, and with all belts on, and power to drive machine being transmitted.

Records were taken of over 2,000 ft. of shafting—in ten different sections, in a few hours, and he had no occasion to touch the shaft, but took his readings from floor level. Obviously, he required to know, at the beginning of his operations, which end of each shaft was the highest; or, in similar manner, which was the lowest. It would be folly, he reasoned, to start from one end to level up, without knowing the respective heights of either end of the shafting. To find this he forecast as follows: (See Fig. 1.)

Apparatus Employed.

The sections being 200 ft. long, he fixed, on to each of the two outer hangers, a mild-steel bar. Projecting downwards, below the shaft, a distance of about 4 ft. 3 in., exactly at a distance of 4 ft., a small hole was drilled in each of the bars, and through these he stretched a length of piano-wire. It was just fixed to the two bars and allowed to sag, as shown—and precisely in the centre of the length of 200 ft., a four-pound weight was suspended by the wire, as shown. A good wood straight-edge, 10 feet long, with a line at the centre of its length, and with a spirit-level combined, was applied, as shown, and the centre line of the straight-edge was made to precisely correspond with the centre of the length of the slack wire; that is, at the spot where the weight was suspended.

Now, it is obvious that if the shaft were level—i.e., each end of similar height, the spirit-level would declare, and record it; but if the end (B) were high, the bubble of the level would approach the end (B); and supposing it required a piece of packing ¼ in. thick under the end of the straight edge (A), to compel the bubble of the level to come to the centre, it would be positive proof that the end of the shaft (B) was high to the extent of ¼ in. in 10 ft., thereby equalling

$$\frac{\frac{1}{4}\text{ in.} \times 100}{10} = 5\text{ in.}$$

in a length of 200 feet.

The particulars were taken in almost as little time as it takes to describe the method, and gave a good basis, from which to proceed with the levelling, or rather testing the level of the various lengths of shafting which served to make up each 200 ft. length. This was done as follows:—(See Fig. 2.)

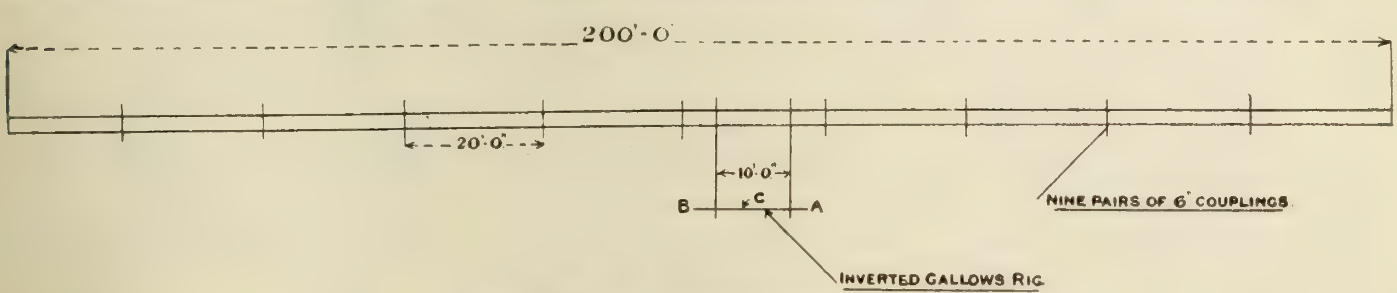

FIG. 2. THE ART OF IMPROVISATION.

Testing the Levels.

The lengths of the shafting were 20 ft., and the hangers about 10 ft. centres. A carefully-constructed inverted gallows rig was acquired, which could be conveniently applied from the floor. The essential feature of the gallows rig was that it could be easily hung from the shafting at places adjacent to the hangers. It was also necessary that the two hanging legs should be of precisely equal length, at least as far as the distance from (A) and (B) to the centre of the shaft was concerned; so that if the shafting, where the rig was applied, was level—a spirit level applied to the true edge of the cross-bar of the gallows would at once declare and record that fact.

If the shaft were not level, the amount of such was recorded by the adjusting apparatus with which modern spirit levels are provided. It was only a question of ratios, to be able to discover from the reading of the level—to what extent the shaft was out in the length of the cross-bar—this length being marked in feet and inches on the bar.

Nothing could be simpler, and with a self-centring grip with which the upper ends of each leg was provided, it was easy to test lengths of shafting of varying diameters, and even when the shaft was running.

* * *

HYDRO-ELECTRIC COMMISSION AND CHATS FALLS.

CHIEF Engineer Gaby and Hydraulic Engineer Acres, of the Ontario Hydro-Electric Commission, with Mayor Ellis, M.P.P., of Ottawa, and several engineering experts from Toronto and Montreal, made an inspection trip relative to the water-powers of Chats Falls, on the Ottawa River, some thirty miles west of Ottawa.

Expropriation proceedings instituted by the Hydro-Electric Commission are pending before the Ontario Railway and Municipal Board, with a view to taking over the present power rights held by Hardy and O'Connor at Chats Falls under a lease granted by the Federal Government in 1911. The Ontario Government has offered $420,000 to the present owners, but they ask three million dollars. The evidence in the case will be heard in September.

The inspection trip was made with a view to enabling the appraisers for the Hydro-Electric Commission to get first-hand information as to the power development possible, and the value of the lease now held by Hardy and O'Connor. The Ontario Government intends to use Chats Falls power as an extension of the Provincial power system for the Ottawa Valley and Eastern Ontario. Over 100,000 horsepower can be developed at the Chats and Ottawa, and the whole surrounding district is vitally interested in the move now under way for insuring cheap power through Provincial development at the Falls.

Practical Data Relative to the Erection of Shafting

By Joseph Horner

Shafting for the transmission of power through belts, ropes ,gears, etc., forms a prominent feature of our factories and industrial plants generally. The necessity of giving its installation more than ordinary attention, and the points to be observed when doing so, are fully dealt with by the writer in the accompanying article.

THE present article is the second and concluding portion of the subject, the previous one published on July 10 covering the features of erection difficulties, weak shafts, influence of wear, shafting layout, erection methods, etc.

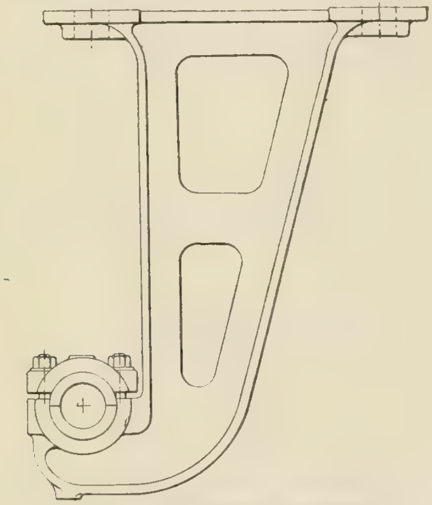

FIG. 12—HANGER BEARING.

Hanger Bearings.

The same methods of plumbing from centre lines laid down on the floor, described in the previous article, are adopted when, as is common, the hanger type of bearing, Figs. 12 and 13, is used bolted to the lower sides of beams. A similar templet is used for locating the center, and the position of the bolt holes, and similar packing pieces are used for adjusting the horizontal alignment of the bearings. A parallel straight-edge is laid along from bearing to bearing, and the height is tested and corrected with a spirit level. The shaft, when afterwards put in, is tested similarly, and also plumbed up from the centre line.

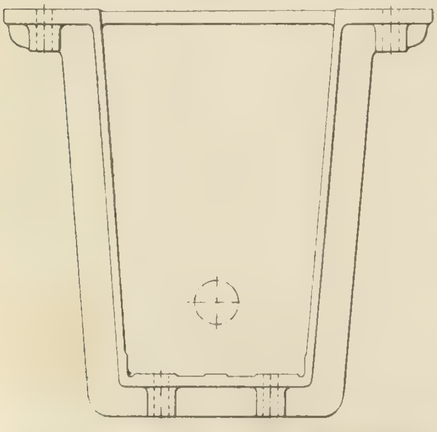

FIG. 13.—HANGER FOR SEPARATE PLUMMER BLOCK.

Swivel Bearings.

When swivel self-adjusting bearings, Fig. 14, are fitted, the same methods as the foregoing are gone through, but not quite the same amount of care is necessary in effecting the horizontal alignment, because the adjusting screws can be used for slight corrections for height, but only, however, to a small amount, in some types, within the range of the setting screws. The lateral adjustments must be exact, as the central axis of the bearing is unalterable in that direction. When that is fixed, the swivel provides accommodation for unequal wear.

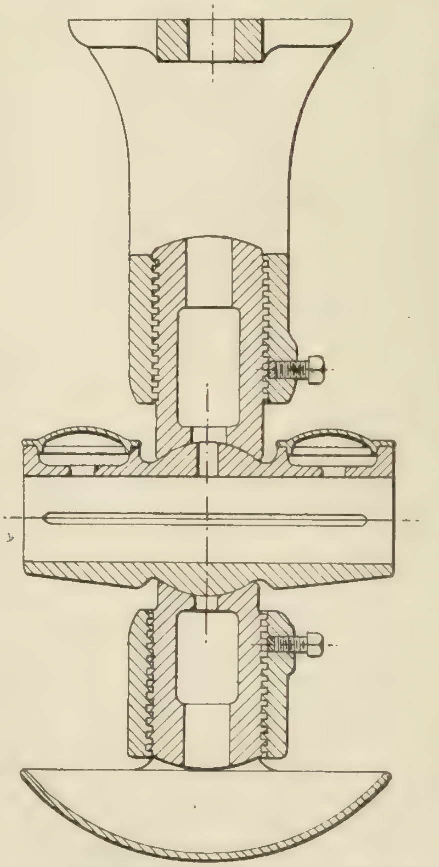

FIG. 14.—ADJUSTABLE SWIVEL BEARING

The Use of Targets.

An old method of erecting shafting, alternative to plumbing from lines on the floor, is by means of targets, or pieces of wood bolted to, and standing out from the joists adjacent to the bearings. This is convenient to adopt when the floor is crowded with machines. The two end bearings are first bolted up in place in positions corresponding with the ends of the shaft. There need be no difficulty in locating two end bearings. Then, as many targets are prepared as there are bearings to be fitted, and one is fixed on a beam adjacent to each bearing in any way convenient.

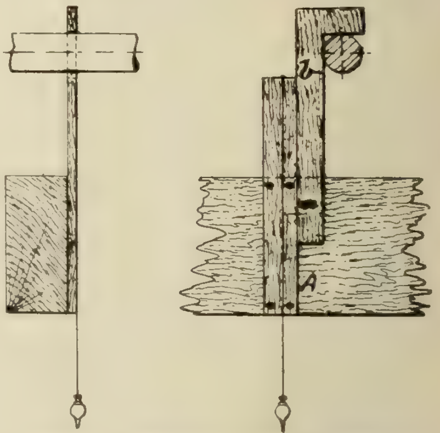

FIG. 15.—TEMPLET FOR PLUMMER BLOCKS.

They can be fitted to horizontal joists or to vertical columns. No hard and fast method need be adopted, but details will vary. Three variations are shown.

Fig. 15 is suitable for plummer blocks bolted on top of a beam; Fig. 16 for a hang down bearing, and Fig. 17 for a wall type of bearing bolted to a column. The point is that one edge (A) is vertical, a datum edge, from which lateral settings can be made. It is set plumb by a bob line suspended from a notch until it coincides exactly with a line drawn parallel with the edge (A). The

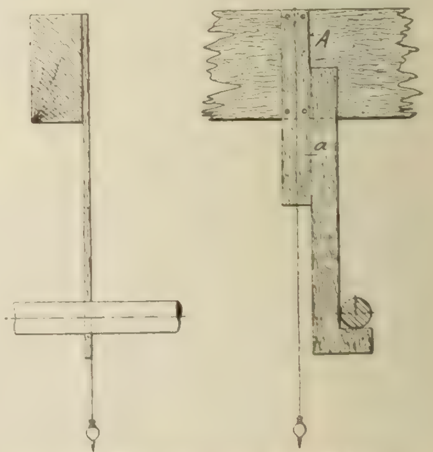

FIG. 16—TEMPLET FOR HANGERS.

position o fthe edge (A) relatively to the shaft is of no importance. It may be 3 in. or 1 in. away, but the strip must be long enough to afford sufficient guidance to the second strip, say from 2 ft. to 3 ft. Also, the edges (A) will all be set exactly in line from the end bearings before being screwed finally. This will be done by stretching a straining line from end to end, standing out to a definite distance from the centres of the end bearings, from which line the edges (A) will be measured with a strip of wood all equidistantly. The vertical datum line will thus be set by the edge (A) of each piece, and all from the end bearings, the location of which is already fixed.

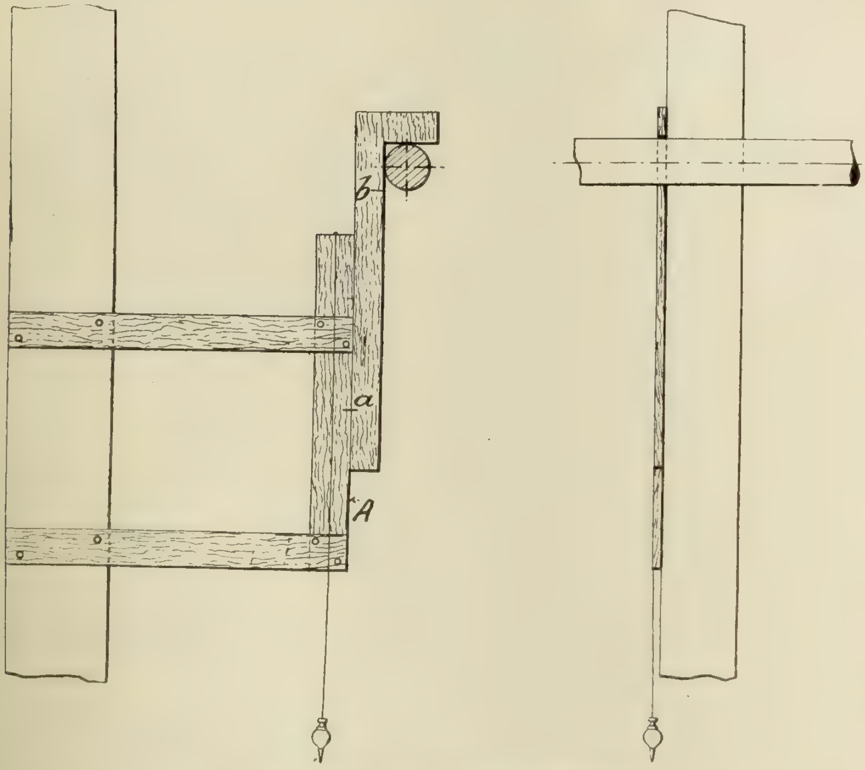

FIG. 17—TEMPLET FOR WALL BRACKET.

The next stage is to settle a horizontal datum line along the edges (A). Here also, position is not of importance but it is as well to have it a foot or eighteen inches from the shaft. This cannot be marked quite so accurately with a straining line as by the use of the level, though as stated in the previous article, a straining line fixed at one end and pulled taut by a suspended weight at the other the line passing over a pulley, will, in a shop of moderate length, have no perceptible sag. The safer way, however, is to tack a light straightedge on the faces (A) of the targets, taking two or three adjacent and starting from one end bearing and levelling with a spirit level, and thence marking the line (A) on the edge A of each target.

Now it is readily seen that the attachment of such a templet alongside each bearing, the edge of each one of which is equidistant from a strained line, and having the horizontal lines all marked at the same height as those on the end targets, affords a ready means for very approximate measurements for the positions of the successive bearings. From their edges and these lines, a square shaped templet (B) can be used set against the vertical edge, to locate the shaft and the bearing block.

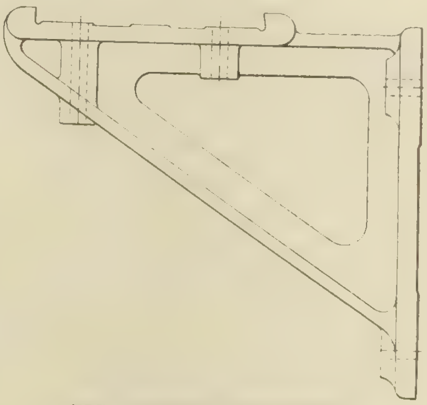

FIG. 18—WALL BRACKET.

Referring to Figs. 15, 16, 17, the method adopted in these is to use a square (B) cut to fit exactly over the shaft in the angle of the square, where a line on the edge is brought to correspond with the datum line (A) on the target. An earlier stage is represented by the line (b) which corresponds with the bottom of the shaft bearing in the pedestal, and which may be used when the packing strips are being planed for setting the vertical positions of the plummer blocks, hangdowns, or wall brackets.

Variations in details are merely matters of convenience to be modified in different cases. The essentials are the alignment of the edges (A) and of the lines (a). After the shafts are in place in their bearings, they can be checked for level by means of a spirit level, and slight corrections made if required by means of the packings under the bearing blocks or brackets, and for horizontal alignment by means of a straining line.

Rigid v. Swivelling Bearings.

If sufficient care is taken in aligning rigid bearings with plumb line and spirit level, they are not so unsatisfactory as the manufacturers of swivelling adjustable bearings say they are. I have known them running for very many years without giving any trouble whatever, merely entailing the renewal of a brass here and there at long intervals. This, of course, presupposes shafts of diameters large enough for their work, bearings placed sufficiently near together, accurately fitting couplings, and pulleys and gears hung properly, in addition to careful alignment.

However, even working under the best conditions, these rigid bearings are not to be recommended because they do not embody the best proportions of length to diameter. Being rigid, an ample length cannot be imparted without increasing the difficulties of aligning. In a swivel bearing, again, the weight and friction of the shaft are distributed over an area of about twice that obtainable in a rigid bearing. The mathematical demonstrations do not concern us here in an account of the methods of erection and the results obtained.

The foregoing remarks apply to bearings carried on any horizontal supports, whether on the timber beams of roof

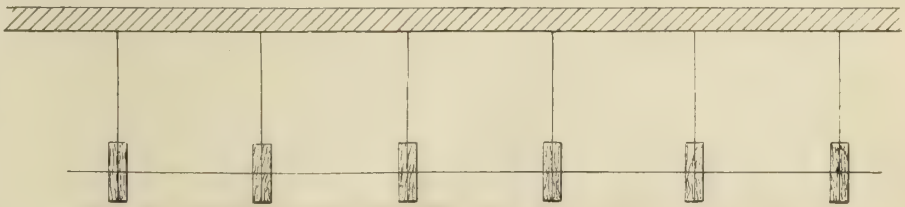

FIG. 19—LAYING DOWN CENTRES FOR WALL BRACKETS ON FLOOR.

principals or longitudinal beams or girders of wood or steel placed for the purpose of carrying bearings, or on supports in the lattice braced pillars which carry the roof principals or the gantries of travelling cranes. The condition is that the bearings are bolted down, or up, to horizontal supports and have no provision for adjustment for height.

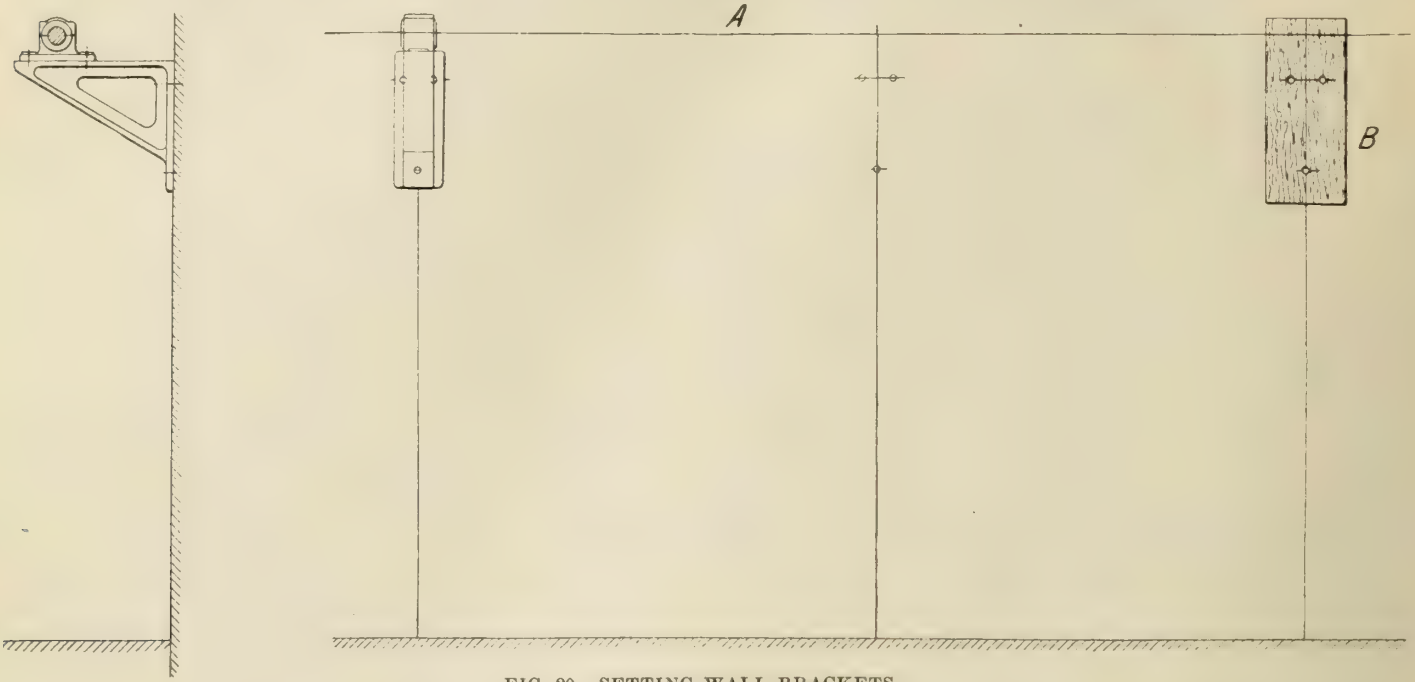

FIG. 20.—SETTING WALL BRACKETS.

Bearings in Wall Brackets.

Large quantities of shafting are carried in bearings supported on brackets bolted to walls. In these too, the bearings are either rigid, or they swivel and are adjustable. The methods of alignment previously explained are adopted after the brackets have been bolted up to the wall. This is done in the following manner:—

The centre line of the shaft being snapped on the floor, the centres of the brackets are marked across these at right angles up as far as the wall, Fig. 19. There, these are raised by a chalked plumb line set over each centre line in succession, and held at top and bottom and snapped, so transferring the lines to the wall Fig. 20. Measurement is then made up from the datum blocks on the floor, Fig. 19, to the wall, to the centre line of the shaft, using a rigid rod for the purpose. Then a line, (A) Fig. 20, is drawn along on the wall using a parallel straightedge and a scribe, and checking the horizontal truth of the straightedge with a spirit level. This will be the line of the shafting in its horizontal plane; or in some circumstances, it may be better to draw a datum line a foot or two above the floor, and measure the shaft line from that.

A templet (B) is made from the brackets corresponding with the feet. Along it, the centre line of the bracket is scribed, and across it the centre line of the shaft, and then the bolt holes are bored in their correct positions in relation to these lines. This templet is laid over the centre lines on the wall, and set to them by its centre lines, and the bolt holes are then marked off directly through it and drilled. The brackets are bolted up in succession, but each is adjusted from its predecessors by means of a parallel straightedge and level before all are made fast. Any slight subsequent adjustments are made in the bearings bolted to them subsequently by the methods already explained, that is, with plumb line, straightedge, and level.

Bearings on Steel Columns.

Brackets are bolted against the lattice braced steel columns which support roofs. This does not alter the method of lining out and fitting. The work is more awkward when they are fitted to round columns, as this requires a concave foot to the bracket, and a concave cap to bolt it up by, the bolts passing through lugs. Except that there are no bolt holes to be marked on the pillar, the general procedure as to centre lines and adjustments is similar to that already described.

Wall Boxes.

The fitting of wall boxes Fig. 22, may include one or more in line. In these a range of horizontal adjustment of the bearing in the box is provided, so that

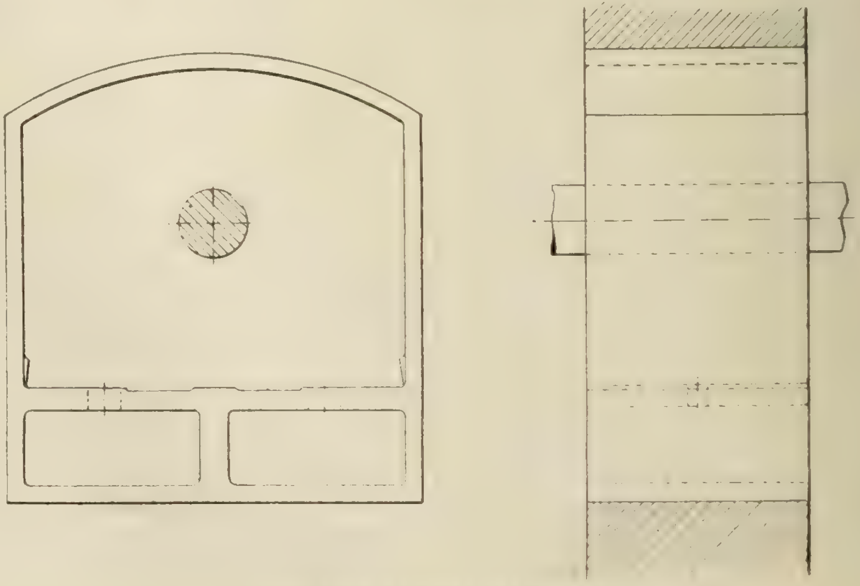

FIG. 22—A TYPICAL WALL BOX.

the fitting of the box itself is only made approximately correct. The actual bearing must be adjusted exactly with level and plumb line after the shaft is laid in, but a close preliminary adjustment can be made in the bearings with a straightedge laid from the bottom of that to the one adjacent, and tested with a spirit level.

Shafting in Crowded Shops.

If new shafting has to be put in a shop which is already crowded with machines, so that the floor cannot be used properly, the work is rather more awkward. There is usually some floor space available underneath the intended new shafting, and, if so, this can be utilized. Two plumb lines can be dropped, one from an adjacent existing shaft, and another representing the place of the new shaft. These can be dropped in the two extreme positions, the distance apart measured with a rod, and the positions marked up on the beams, after which the procedure will be as before. If, however, a new line of shaft has to be erected over existing machines, the positions at the ends will be obtained by direct measurement from another shaft adjacent, using a rod for the purpose, and the centre lines will be marked on the beams with a scribe or by snapping a chalk line. No difficulties can arise which cannot be dealt with by making use of spirit level and plumb bob and rigid rods.

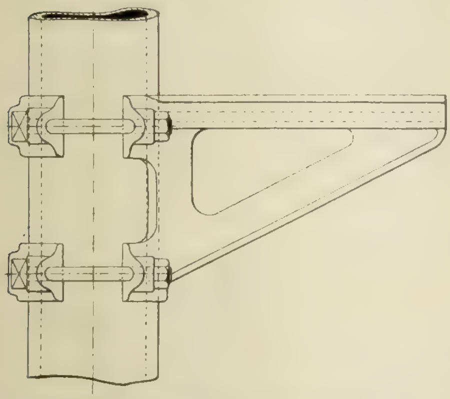

FIG 21—BRACKET ATTACHED TO COLUMN.

⁂

MEDICINE HAT INDUSTRIAL ACTIVITIES.

THE publicity authorities of the City of Medicine Hat, Alberta, have furnished the following particulars with regard to the many industrial ventures starting in that city.

After many months spent in construction, setting equipment and machinery making moulds, and trying out the various departments of the factory, the Medicine Hat Pottery Co. is now in full operation and is turning out stone ware that is pronounced second to none ever brought into Alberta. The product consists of butter crocks, mixing bowls, demijohns, jugs, flower pots, hanging baskets, etc., in all the various sizes demanded by the trade in Western Canada. This week the traveller for this company booked orders for ten carloads of stone ware in one day, showing that the demand is all and more than was anticipated.

Probably the busiest place in Alberta to-day is the works of Martin & Phillips, proprietors of the International Supply Co., well diggers and dealers in supplies for that purpose. The company recently secured a contract from the city of Medicine Hat for sinking nine natural gas wells, besides which the concern has contracts for four other wells at outside points. On the former contract Manager Martin now has three rigs in use, and more will be installed if needed. The foundry and machine shop of the company has been doubled in size this year, and there is none too much room now to care for the orders constantly coming in.

The foundry of the Medicine Hat Pump and Brass Mfg. Co. has been in use for a time by the International Supply Co. while the latter's new foundry addition was being constructed, and while the equipment and patterns for the former were being manufactured and sent forward. It is expected now that the pump and brass works will be in full operation in the course of two or three weeks, after many delays that could not be foreseen.

The Brick Co.

Installing of machinery at the enlarged works of the Medicine Hat Brick Co. is now nearly completed. A dozen or more carloads of equipment have been added to the plant, and the capacity for turning out stiff-mud, wire-cut brick will be around 60,000,000 annually. The latest and most up-to-date machinery has been secured, and the company is already making shipments to points all over Saskatchewan and Alberta.

Another furnace has been added to the equipment of the Alberta Iron Rolling Mills, to enable the management to keep up with the orders constantly coming in to this busy establishment, where over 100 men are constantly employed.

Brick work has been about completed on the main structure of the Medicine Hat Concrete Products Co., the building being 50 x 150 feet in size. The roof is now being put on, and the company is about ready to fill some of the orders which it has on hand.

Cement Plant.

Manager J. E. Davies, of the Alberta Foundry and Machine Co., who added to the pattern shop and other buildings this year, and also put in considerably more machinery, keeps his full force at work with the many orders which are constantly coming in from many outside points, as well as locally.

Detailed plans and specifications for the great works of the Canada Cement Co., which will have a capacity of 4,000 barrels daily when completed, are now nearly done. Meantime a force of workmen has been busy erecting bunk and mess houses, storehouses, warehouse, office, etc., and large quantities of stores, machinery and building equipment are being received. Shortly the physical work of construction will be started on the main buildings of the plant, which will cover ten or twelve acres when several hundred men will be given steady employment for something like a year.

⁂

AUTOS FOR CONTRACTORS.

IN the final spurt to complete the Canadian Northern main line from the head of the Great Lakes to Sudbury, a distance of about 500 miles, Foley Bros. who have the main contract for the construction work, have put into service seven big automobiles, which are equipped to run along the rails as accurately and at as great speed as the average locomotive.

It is the first time that automobiles so equipped have figured in railway construction work in the west, and according to Mr. C. Foley, of the firm of Foley Bros., they have proved successful beyond all expectations. Cars in which workmen are taken to and from work and in which supplies are carried, are drawn by the automobiles, which on occasion attain a speed of thirty miles an hour.

Mr. Foley, who arrived in one of the cars from Nepigon this week, said that present indications are that the main line will be completed through to Sudbury early this winter, in ample time to handle a share of the new grain crop.

⁂

BOVING & CO., OF CANADA, LTD.

BOVING & CO., of Canada, Ltd., who recently acquired works at Lindsay, Ontario, have been awarded the contract by the Hydro-Electric Power Commission of Ontario for the hydraulic equipment at Wasdells Falls.

Their designs are supplied by their affiliated Companies in London, England, and Sweden, and it is satisfactory to note that in future their machinery will be turned out at the Lindsay Works; the units required by the Hydro Electric Commission being the first large job to go into these shops.

REAMERS AND SHELL REAMER BAR SIZES.

By F. Scriber.

THE practice which has come into vogue in recent years of buying different parts of tools which are required to work together on a machine job necessitates a more general knowledge of the sizes of tools which the different makers carry in stock and their dimensions, so as to enable the user to select those which he can make cheapest in his own shop, and go ahead with them, while the other tools are being bought.

SHANKS FOR FLUTED CHUCKING REAMERS.

The accompanying table, "Arbor for Shell Reamers," gives dimensions of the arbor and clutch collar for "Morse" reamers, from 4 in. to 6 in. diameter, which are used for making reamers, or can be employed in part for making up special arbors, an application of which is shown by Fig. 1. This is an arbor, having a floating holder for the shank and a pilot at the end for holding the reamer in correct alignment to the work. The reamer is a standard one and is bought by the customer, while the arbor is furnished for the job by the machine tool builder, and the two must go together when received at the customers' works, this being made possible by the use of the table for getting the sizes.

Another table which the writer has found very useful is that of "Shanks for Fluted Chucking Reamers." This is not only valuable when making up reamers, but is also handy to have when making up floating reamer bushings and reamer bushings (shown with reamers in place by Fig. 2 of this article). By referring to the table, the diameter of the shank (C) can be found for the size reamer used, this being the diameter of the hole in the plain bushing, while the hole in the floating bushing is made larger to give a floating fit.

As will be noticed at the top of these tables, the sizes given conform to the standard practice of the "Morse Twist Drill and Machine Co.," and are similar to tables used by the writer.

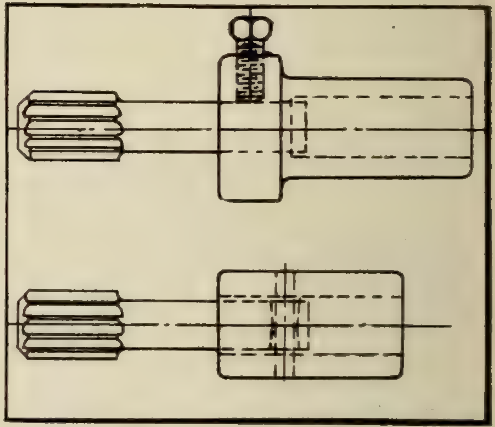

FIG. 2. REAMER BUSHINGS, PLAIN AND FLOATING.

EXAMPLES OF IMPOSSIBLE CONSTRUCTION.

IN a standard work on machine design are given a number of general rules relating to the underlying principles of design and construction. Prominent among these will be found one as follows:—"Avoid impossible construction, i.e., constructions which cannot be assembled or disassembled." At first thought, one would say that such a rule is unnecessary for no one would do such a thing; and probably no one would knowingly, or rather thinkingly, but it is a fact that incompetent persons have produced such designs, and that competent persons have, in times of rush and special stress, done the same thing.

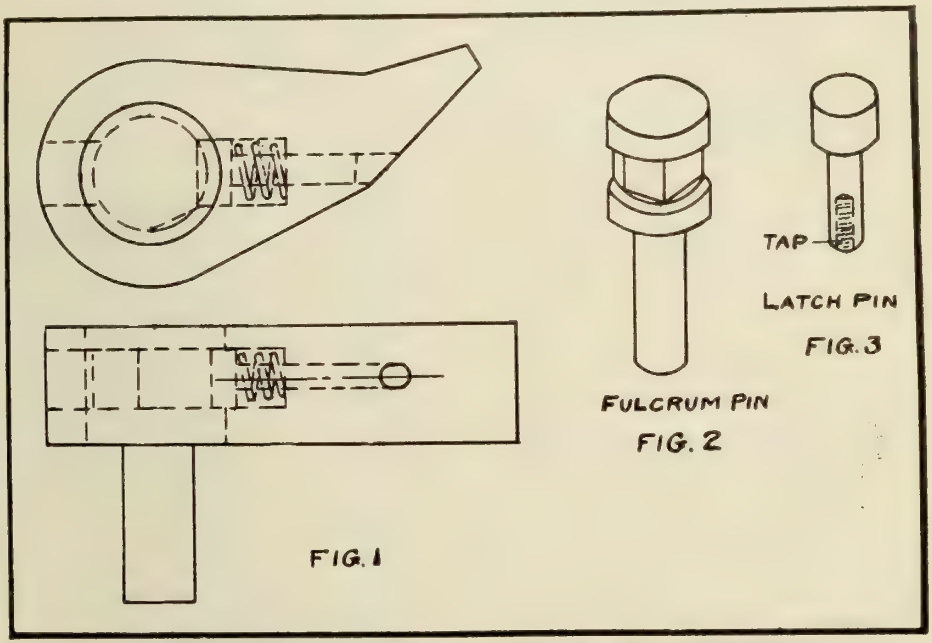
and these designs have been worked into iron and steel with expensive and humiliating results.

In dismantling some machinery for removal, the writer ran across two interesting examples of impossible construction which will be described. Both are hidden pitfalls for the designer—one is so neat and substantial as to be really termed a clever piece of work; and the other is so simple (to construct) that no one would become suspicious until assembling was to be done.

The “feed” of several parts on a bundling machine was by means of ratchet wheels actuated by spring pawls. One of these pawls is shown in Fig. 1. The fulcrum pin is “necked” in its centre where it fits into the pawl, and on this neck are milled flats for the pawl pin, in working and release positions. The pin had the usual spring behind it, its stem and the spring working in drilled holes in the pawl. In operation, these pawls could not be improved upon, and their neat design was a delight to the eye.

It was found impossible, however, to take them apart, and we had to destroy the fulcrum pins and make new ones. Before setting up in the new location, we made sure that each latch pin had a hole drilled and tapped in its stem, so that a screw could be inserted to back them away from the neck.

On the same machine was a 2½ in. shaft that had to be removed. This turned in babbitted bearings and was supposed to be easy to take out; but it didn't come, and driving didn't start it. Finally, after wasting a couple of hours in speculation and experiment, the babbitt was melted out. To our surprise, we beheld two V-beads in each bearing. The designer had “designed” a neat and easy construction without resorting to shoulders, unsightly collars, or split bearings, but had totally forgotten the sure-to-come time of removal.



PAWL CONSTRUCTION THAT COULD NOT BE DISASSEMBLED.

SPRING TESTING FIXTURE.

By A. L. Monrad.

SOME time ago it became necessary to make a gauge for inspection of coil springs of various lengths and tensile strengths. The tension of these springs required to be extremely accurate, and as this instrument will detect any inaccuracy within its reach, and has proven it worth so fully, the fixture will doubtless be of some interest to readers of Canadian Machinery.

The coil springs here described are all made of tempered steel wire for open or compress spring. In manufacturing these, an attempt was made to determine the co-efficient of torsional elasticity, the safe stress for different sizes of wire, and different ratios of mean diameter of spring to diameter of wire. Every spring, before testing for capacity and deflection, was first closed coil to coil on an arbor to keep it straight, and put several times in a hydraulic press to remove all permanent set. It was then tested for capacity and corresponding deflection. Springs of small diameter may safely be subjected to a higher stress than those of larger diameter.

Detail of Fixture.

On top of a cast iron plate (A) one inch thick, and planed top and bottom, is fitted in the steel block (B), the indicator pointer (C). This block is secured to the plate with 3 screws and 2 dowel pins. The indicator body fits the slot in the block, and is held stationary with two set screws (D). In about the middle of indicator, and in machined square is a seat for a swivel spiral spring arbor (E), which oscillates freely upon a plug end without any support from underneath, and so is arranged that the

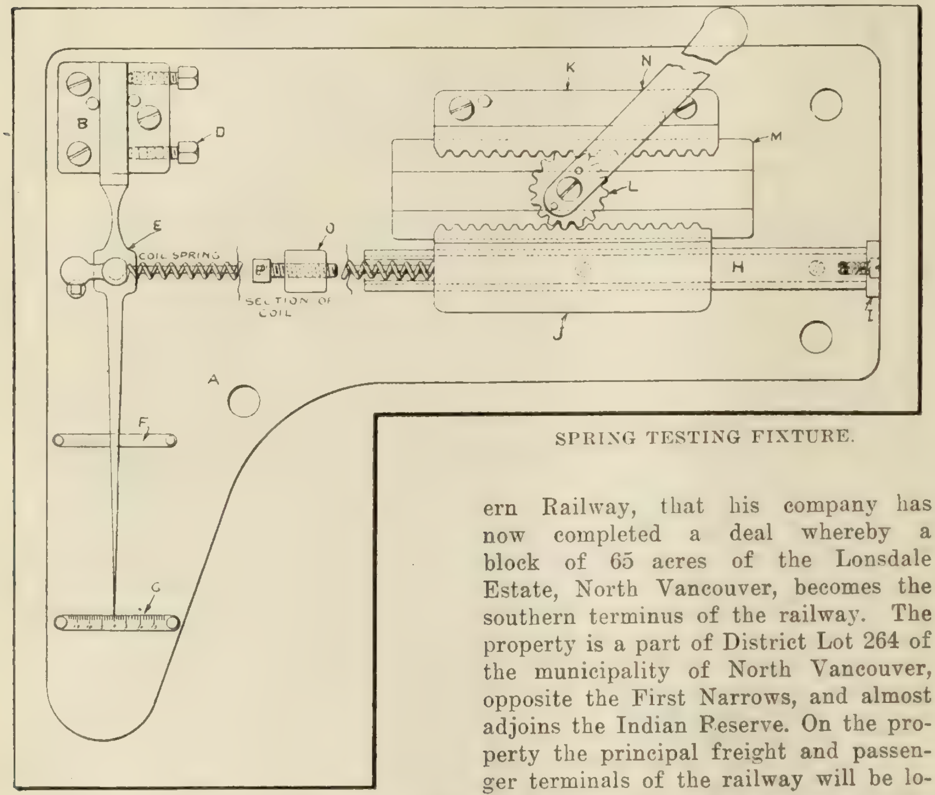
ARBORS FOR SHELL REAMERS—ROSE AND FLUTED.

spring arbor can be taken out at will. On the other end of the indicator point is placed a support for a plate (F), held on 2 pins. The indicator point itself rests on a division plate (G), also located on two pins.

A dovetailed steel slide bar (H) is placed and held in position with 2 cap screws, and a stop (I) is located on the end with a screw. On top of this dovetailed steel bar is fitted a cast iron slide (J) with a rack cut in on one side. This has a duplicate (K) on the other side and two dowel pins. Between these two racks is placed a pinion gear (L) on to a cast iron T slide (M), with a screw through the handle (N), held with two pins to the gear.

The handle (N) is moved forward, with a spiral spring on the arbor, against the end of slide (J), until it comes to a stop (O). This can be adjusted by set screw (P), with a master spring in position, until the indicator reads to zero. Any difference of tension between the spring tested and the model spring is recorded very accurately on the graduated division plate.



SPRING TESTING FIXTURE.

* * *

CROP CONDITIONS NORMAL.

HARVEST has commenced in Ontario and Southern Alberta. Cutting will be general in the West by the middle of August, despite the prophecy of a late harvest by self-constituted experts. The weather generally during the past week has continued to be favorable, and it is quite normal weather for the West. Districts that a few weeks ago were reported as having little chance of a crop of any kind are now entertaining hopes of gathering in a normal yield. As a result of the outlook business has become very buoyant throughout the Prairie Provinces. This is one of the best signs of healthy crop conditions. Usually the merchants in the purely grain growing districts refuse to commit themselves to heavy purchases until the crop looks assured. They are buying now and jobbers are in consequence feeling the result.

* * *

VANCOUVER INDUSTRIAL ACTIVITIES.

ANNOUNCEMENT has just been made by Mr. D'Arcy Tate, vice-president of the Pacific Great Eastern Railway, that his company has now completed a deal whereby a block of 65 acres of the Lonsdale Estate, North Vancouver, becomes the southern terminus of the railway. The property is a part of District Lot 264 of the municipality of North Vancouver, opposite the First Narrows, and almost adjoins the Indian Reserve. On the property the principal freight and passenger terminals of the railway will be located in addition to wharves on the foreshore of Burrard Inlet, which is now held under lease by the new owners from the Dominion Government. Under the sale agreement the railway is bound to expend in development work $100,000 by December, 1915, and $400,000 by the end of 1918. Some idea of the railway's plans may be learned by the following clause in the agreement of sale: "The purchaser to erect, with all reasonable despatch, and to maintain for twenty years upon the northeast corner of district lot 264, its main passenger station for the north shore, and to establish for said period and to maintain on said lands the railway terminals, freight sheds, round houses, machine shops, railway yards and other railway facilities necessary and appropriate at such terminal; and also to maintain upon said lands (or on leasehold lands, i.e., the foreshore), wharves for the use of the coastwise and ocean shipping and to make and for the same period maintain on said lands the shipping terminals of the purchaser for Burrard Inlet, but nothing herein contained shall operate or bind the purchaser to own or operate vessels."

NEW METALIZING PROCESS.

INTERESTING experiments, says the Glasgow Herald, were conducted recently in Stewarts and Lloyds' warehouse, Glasgow, with the Ostermann apparatus for the metalizing of materials of all kinds. As is well known, metals can be galvanized by a variety of processes, all of which, however, have material disadvantages, either because of their limited scope or their high cost. During the experiments with the Ostermann apparatus it was shown that the plant was capable of coating homogeneously a variety of articles in metal, wood, glass, paper, and stone.

The process is simple and effective, and is claimed to be more economical than any known system of galvanizing. It consists of filling up completely and homogeneously the pores of the materials to be coated by what resembles a vapor, but which is really a fluid metal, such as zinc, lead, tin, aluminium, copper, bronze, nickel, or steel, or alloys of any of these. The coating is forced at high pressure from the nozzle of the machine in a thoroughly atomised state, with the result that when the fine atoms of liquid metal come in contact with the cold surface of the object to be coated (which is in its natural cold state), they immediately contract and a homogeneous amalgamation takes place so complete that when the piece of metal thus treated is bent, twisted, or hammered, it shows less trace of bursting and peeling than the original surface might have done.

It is claimed for the process that it can be used for an exceedingly wide variety of purposes, from the coating of ships' bottoms or other large steel structures to the metalizing of looking-glasses, or even of fine woven material such as that which is used in the making of aeroplanes and airships, and that this spraying system is much more effective and generally satisfactory than ordinary galvanizing.

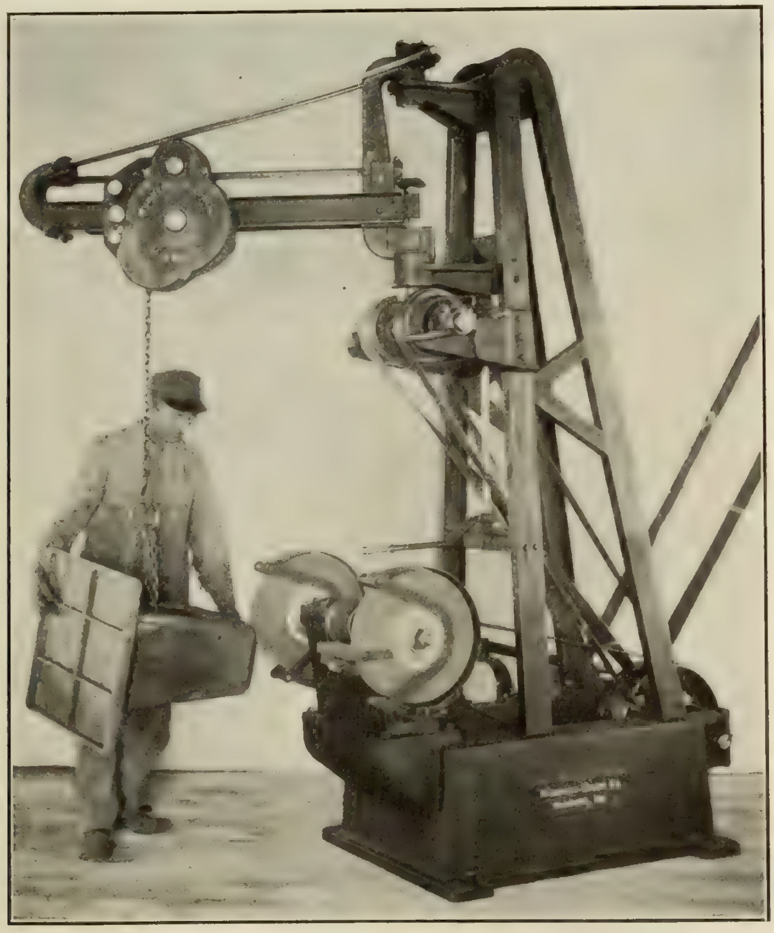
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

MUMMERT-DIXON CRANE GRINDER.

THE Mummert-Dixon Crane Grinder is designed for grinding castings, and for handling pieces which are usually too heavy and large to grind in the ordinary way. It is virtually a grinding stand, combined with a power jib crane, the advantageous features of this combination being immediately apparent to anyone having castings to grind. In grinding castings which are too heavy to be lifted by hand, the crane supports them at the proper height and distance from the wheel. The operator needs only to swing them against and along the wheel, being unencumbered by any hard labor of hand lifting, and doing the work with greatest ease and rapidity.



MUMMERT—DIXON CRANE GRINDER.

The hoist is operated by power, and the raising and lowering is controlled by a lever conveniently located. The casting can be swung in any position horizontally,, and suspended at any height vertically, making it possible, therefore, to go all over a casting in the least possible time. Provision is also made for operating the hoist by hand through a crank handle which slips on the end of the clutch shaft.

The hoist-trolley which is mounted on the jib is driven by a square shaft, which gets its drive through bevel gears from the clutch pulleys mounted on the shaft supported by a bracket attached to the frames. These clutch pulleys, one for hoisting and the other for lowering, are driven by belts from the countershaft at the back of the machine. The hand lever controls both clutches. Moving it in one direction engages the lifting clutch, and, in the other direction, the lowering clutch. The central position is neutral. The trolley follows in or out on the jib as the workman moves the casting. The swinging jib also follows with the casting.

The emery wheel stand is mounted at the front of the heavy base, and has a forward overhang, giving plenty of clearance in front and under the wheels. The arbor, which is of steel, runs in long self-oiling bearings. A detachable rest is provided, which may be used for lighter castings. The wheels are protected with substantial steel guards. On the back part of the base sets the two steel frames constructed of channels to which are fastened the brackets which support the swing arm of the jib crane. The countershaft, which runs in self-oiling bearings, is placed at the back, thus putting all belts out of the way.

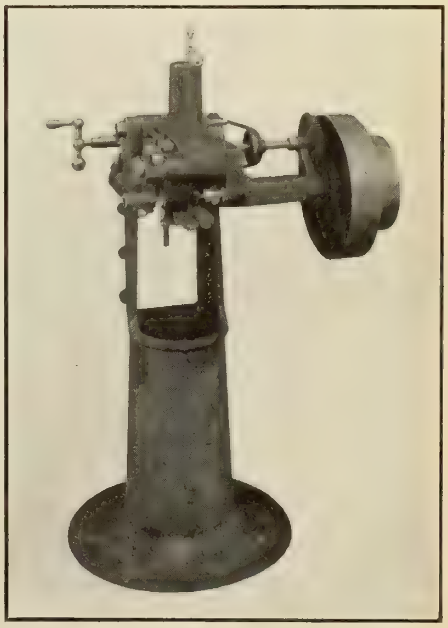
The Mummert-Dixon Co., Hanover, Pa., are builders of this crane grinder.

◆

KEYSEATER AND MILLING MACHINE.

OUR illustration shows a handy little machine put on the market recently by the Premier Machinery Co., Milwaukee, Wisconsin. It is adapted for slotting engine connecting rods, commutator slotting, slotting tubing, squaring up shaft rods, etc., and can be taken off main base and clamped on any shaft for keyway cutting by hand.

All parts are machined in jigs, all gears are housed, and no countershaft is necessary, the drive being direct from line shaft. The construction is rigid and powerful, and the spindle is driven by patent friction internal expanding



THE HERCULES MILLING MACHINIE.

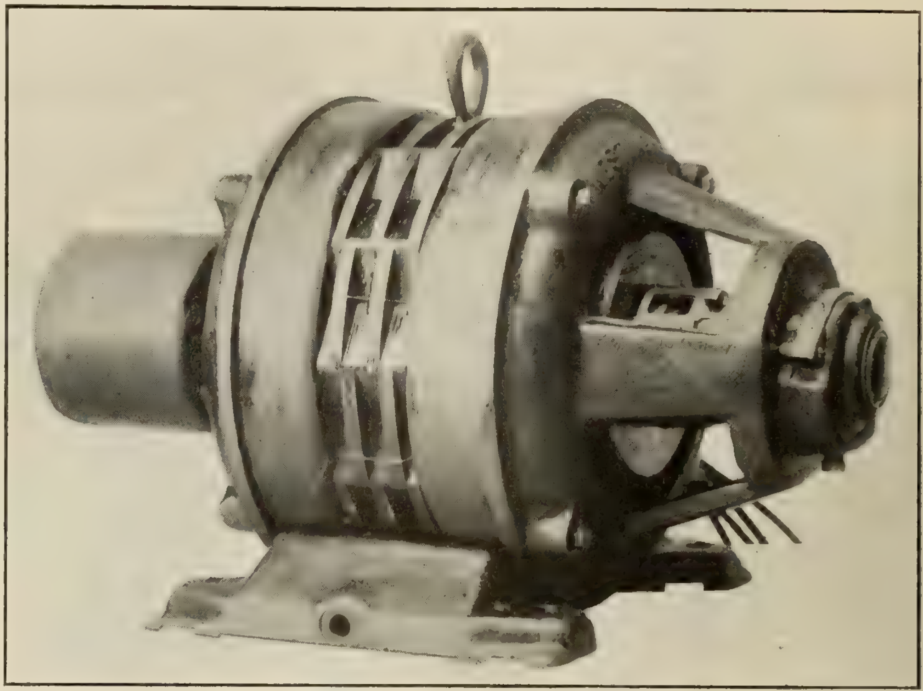
clutch. Power down feed and automatic trip, also power longitudinal feed 3 step cone, giving 3 changes of feed form features of this machine. The patent feed control prevents gouging of the cutter and affords absolute rigidity. The longitudinal travel of the table is 6 inches. Gears can be cut up to 20 in. diameter and 4 in. face, by means of an extra attachment. The net weight of the machine is 275 pounds complete.

MOTOR-DRIVEN DOUBLE WET GRINDER.

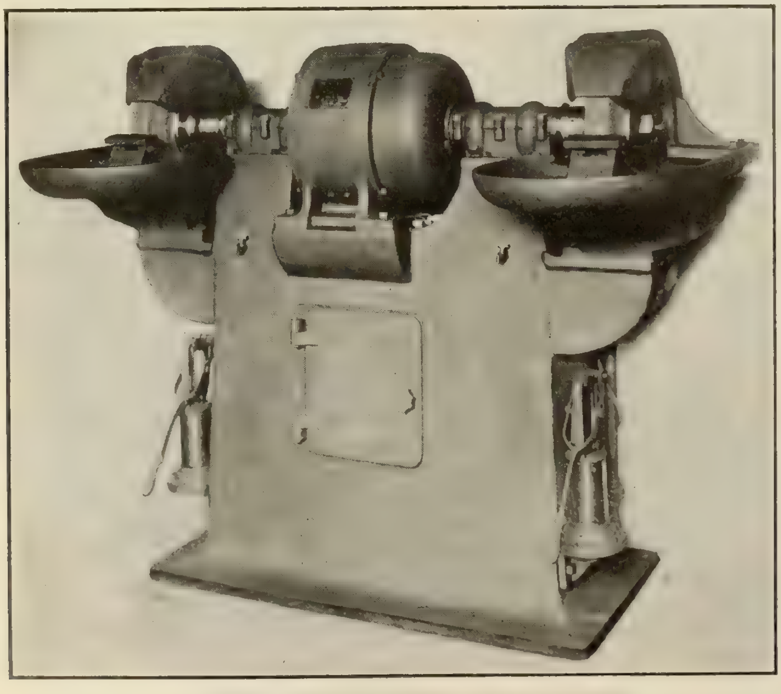
A NEWLY designed motor-driven double wet tool grinder has recently been placed on the market by the Bridgeport Safety Emery Wheel Co., Bridgeport, Conn., and is shown in the accompanying illustration.

The grinding wheels are supplied with water by means of hand operated air pumps, the water reservoirs being located in both ends of the base, extending from top to bottom of the frame. This method of maintaining the water level at proper height obviates the necessity of frequent filling. If at any time the emery wheels begin to run dry, a few strokes on the pumps will increase the air pressure on the head of the column, which will force the water up to a level of the grinder.

On this particular machine the bearings are 10½ inches long. They are considerably longer than ordinarily required, but are employed for the reason that in this type of apparatus it is always necessary to have bearings both long and large because of the great leverage effect produced on the wheels by heavy grinding. The diameter of the spindle in the bearings and between flanges is 1¾ and 1½ inches, respectively. The spindle is 52 inches in length, and carries two wheels, each 14 inches in diameter and 2 inches thick. The machine is driven by a 1½ h.p. 1,200 r.p.m. Westinghouse series wound motor.



NEW WESTINGHOUSE SINGLE PHASE MOTOR.



MOTOR DRIVEN DOUBLE WET GRINDER.

NEW WESTINGHOUSE SINGLE-PHASE MOTOR.

THE Westinghouse Electric & Mfg. Co. has placed on the market a new line of single-phase motors, made in capacities of from 2 to 10 horsepower, and suitable for the majority of constant speed applications within their capacities. The motor is of the repulsion-starting type, and when up to speed, runs as an induction motor. For most applications, it can be connected directly to the line, but where very low starting current is desired, a starting rheostat can be used.

The frame is so designed that it combines great strength and radiating capacity with minimum weight and over-all dimensions. The laminations are riveted together under pressure, and pressed steel end plates are riveted to the unit thus formed. The foot, or base, is of pressed steel plate securely riveted to the end plates. This use of pressed steel marks an important step forward in the design of large single-phase motors. The bearings are large and dust-proof. The rotor coils are form-wound, and arranged to permit excellent ventilation. The commutator is of the radial type with undercut mica segments, and the shaft can be pressed out of the rotor without disturbing the windings or the commutator. Each motor can be arranged for operation on either 110 or 220 volt circuits.

* * *

Montreal, Que.—An order has been placed for 75 "Mikado" locomotives by the G.T.R. fifty of them to be used on the Canadian lines, the other 25 in the United States. The new locomotives will cost $26,000 each, so that the company will pay out $1,875,000 next year for motive power. Most of them will be built in the Montreal shops, and some in Philadelphia.

Vol. X. JULY 31, 1913 No. 5

ENCOURAGING INDUSTRIAL OUTLOOK.

AFTER the first few very hot days of what afterwards develops into a very hot summer, we somehow get accustomed to prevailing conditions, and while we are disposed to pass all kinds of uncomplimentary remarks concerning a temperature of 90 or 95 degrees in the shade about the middle of May, a month later we take for the most part not even passing notice of equal and generally more continuously higher flights of the mercury.

It seems to us much the same condition of affairs with regard to business. The cry of tight money and the necessity, therefore, of industrial enterprises curtailing their output, came, not altogether with the suddenness of a burst of high temperature in May, but all the same with a somewhat similar effect. The fact that those in control of our purse strings bore a prominent part in spreading reports of an impending industrial depression, carried not a little weight in producing at least, a depressing effect, but strange to say, just as we are now sweltering day after day, unmurmuringly for the most part in what is after all a most welcome and enjoyable Canadian summer, we, likewise are now largely, if not altogether oblivious and forgetful of money stringency and business restriction.

From a list of firms engaged in machinery and general mechanical engineering product manufacturing, on whom our representative recently called, there has been secured unmistakable evidence, that for the most part, and this is a quite normal condition, these are working to capacity, and in some cases, work is actually being refused, on the latter account. In what are known as boom times throughout our land, every enterprise cannot lay claim to a share; so is it, meantime, there are industries which are not capacity favored, and there are units in like spheres with those enjoying the full cup, who, it may be, are simply holding their own.

We say again, therefore, that the general industrial outlook disposes to optimism, and why should it be otherwise? Our country's development is proceeding apace, its mineral and agricultural wealth is being both more systematically and quantitatively harvested, and top of all, there is no widespread and uncontrolled profligacy and recklessness manifesting itself in our public or private life. As we now take little notice of and pay the minimum of heed to the antics of Old Sol, and, get about our duties just the same, it will be just as well for us to let talk of industrial depression and tight money bear equally lightly, for by so doing, both we, individually, and the particular industry in which we fill a place and perform a necessary part, will benefit, and the era of prosperity be continued and extended.

* * *

VACATIONS.

VACATIONS are again in order, and just as surely as their season approaches, all of us are more or less ready to avail ourselves of the brief respite from business care and worry which they are intended to secure. It is, we think, not as fully realized as it might and should be, that a change of occupation and surroundings constitute in large part the conditions which go to make our annual holiday. An all-too-prevalent idea exists that we must get away to some more or less out-of-the-way place, back from the madding crowd and the din and rattle of machinery, and there compose ourselves and rest, the aim and intent being, of course, that we will be physically benefitted, and return to our duties with renewed vigor and earnestness.

The consummation of this ideal is, we are afraid, seldom achieved, unfortunately, and why? All of us are possessed of an innate sense of the necessity of a restful holiday, and most education imparted to us and thrust across our path has a like trend. Again, we are not altogether unanimous in our own mind as to what course should be adopted; and is it little wonder? Activity of the most exacting nature may be our daily portion for some 50 weeks of the year, and we find it hard to shut down altogether or even to any great extent for the remaining two weeks which we claim as our own. To say then, that under such circumstances, complete rest and quiet are what we need in the way of a tonic, is more or less ridiculous. The supposed very ideality of surroundings to secure these conditions, would open up opportunity of being more oppressed with our work than ever, due to our being, as it were, left entirely alone with ourselves and our thoughts.

Again, as has been already stated, we are not usually unanimous in our own mind concerning the nature and disposition of our holiday, because of a desire to substitute some pleasurable activity for the restful feature, and perchance the leaning in this direction carries most weight. If such be our desire, no parleying need take place as to the right course to adopt, for undoubtedly the greatest benefit physically and mentally will result from our yielding to the most powerful impulse.

It should be unnecessary to state that riot and license are, of course, excluded when determining our decision, or, for that matter, excess of any kind, and if the like care be exercised in protecting our physical and mental constitution when on holiday bent, as when pursuing our regular occupation, then no question will arise as to the recuperative effect of the holiday we were privileged to enjoy and that according to our own particular taste and inclination.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Toronto, July 29, 1913.—The market for general mechanical engineering material continues quiet, with price changes within narrow limits. Business in finished iron and steel from warehouse has been very good during the last two weeks, the demand for boiler tubes, sheets, bars, etc., having started again. It was reported locally this week that the National Wire Co., of Montreal, will be a factor in the Canadian market within the next two weeks. This is a new concern which formerly went under the name of the Canada Wire Co. A prominent Montreal wire rope company has written to say that business this year, as compared with the last two years, is practically the same. The demand seems to be from about the same quarters, and from what they can see ahead, they feel that for several years yet they are going to have an equally good time, particularly in this particular line.

Metals.

Tin has fluctuated between 38 cents and 41 cents, a condition brought about largely by manipulation, as sales have been both small and infrequent. The market for copper seems to be getting better every week. Recently the price took another drop, but since then it has been slowly rising, and to-day is quoted at $15.75. Local trade is fairly active, and dealers and manufacturers expect the price of copper to further increase. During the recent disturbance copper wire has been the market's salvation. There has been quite a demand for this commodity, especially for electrical work. The price of aluminum is down to $18, which is a considerable decrease on last week's price. This is due to decreased consumption, the supply at present being much greater than the demand. The market for old metal is fairly active, principally in copper wire and white metals.

St. John, N.B., July 26, 1913.—The common council has voted to erect an incinerating plant in the city at a cost of approximately $50,000. No tenders have as yet been authorized, but a site has been chosen, and it is planned to make a start as soon as the money market shows an easier tendency. The plant of the Partington Pulp and Paper Co., Ltd., has been entirely renovated, and the general overhauling to which it was subjected has been responsible for an increased production of bleached sulphite. The expectation is that if the money market shows an improvement soon four machines for the manufacture of special grades of paper will be installed. A spur line from the mill to the C. P. R. tracks is being constructed, thus doing away with the expense of supporting motor trucks which were formerly in use. Various industries are being hampered somewhat by the strike amongst the lumber mill workers, which has continued for more than a month now, and it is thought that strong pressure will be brought to bear to have the trouble ended. The various lime kilns which have been in operation near the city have been compelled to close for lack of fuel, and lime is being imported from Upper Canada and the States. Different wood-working factories are running short on material, and shipping has been much retarded. There has been no attempt made by either owners of workmen to discontinue the strike, which has been general, and the following large plants are affected: Two mills owned by the Stetson, Cutler Co., Ltd.; one by John E. Moore, Charles Miller, Hilyard Bros., Miller Bros., F. E. Sayre, Murray & Gregory, Randolph & Baker, and Warner & Co. The dispute concerns wages, and about 1,600 men have been out of work for a considerable time, although the majority of them are now employed in other lines of labor. In other parts of the province lumbering is going on full blast, but the season has been disastrous so far as St. John is concerned. A notable departure has been made in the policy of the Maritime Nail Co., Ltd., of St. John, in that they have purchased the plant of a rod mill company at Voelblingen, Germany, for the purpose of supplying their Canadian nail works with rods. Stanley Elkin returned a few days ago from Europe, and was present when the first shipment of 4,000 tons was made to St. John, the largest cargo of its kind ever brought to Canada. Mr. Elkin said he found the mill, which was formerly in the German Steel Trust, in excellent working order, and by their establishment of these works in Germany the Maritime Nail Co. will effect a great saving in cost of operating, and be able to put their mills in an advanced position in the competitive field. Mr. Elkin interested several German manufacturers in the scheme, and on the board of directors are: A. Roechling, president of the Stahl Works, Berhard; W. Mosher, director of the Deutsche Wire Rod Syndicate, and Norton Griffiths, M.P. The capacity of the German mills is 40,000 tons a year, and their being acquired by the local company is a strong step forward. John Kenny, factory inspector, returned this week after a trip of inspection throughout the North Shore and eastern end of the province, and reported that conditions in each of these places were most encouraging from a business viewpoint. Heavy shipments were being made from the various plants, and the only dark spot was at Sackville, where about 400 moulders had been on strike. It was expected that the strike would soon be settled, however. It was announced this week that the C. P. R. would instal ten new tracks in West St. John in connection with their new million dollar elevator, on which extensive operations are now in progress. It is expected that the new elevator, which will not interfere in any way with the work at the old plant, will be completed and in operation by December 1. A. K. Beauvais, foreman with the Dominion Bridge Co., arrived in the city yesterday to attend to the supervision of the steel work in connection with the superstructure of the Atlantic Sugar Refinieries, Ltd., at the Ballast Wharf. Bases for the heavy steel columns were placed in position this week, and the expectation is that the actual steel construction work will begin the first of next week.

QUEBEC BRIDGE PROGRESSING.

THE sub-structure on the north side of the Quebec bridge will be completed in about a month's time, and there is only about twelve and a half per cent. of the entire contract, embracing both the Quebec and Levis sides, remaining to be executed. This information was given out by Mr. J. T. Davis, of the contracting firm of M. P. and J. T. Davis, who were awarded the contract the other day for the big dry dock on the Levis side of the river.

In speaking of this undertaking, which the firm are to have completed in three years, Mr. Davis said that within a week of the signing of the contract, the work will be started. A good deal of the work can be carried on in winter. Speaking of the Transcontinental contract yet in the hands of the firm, east of Chaudiere, Mr. Davis said that their representative, Mr. William Daly, is pushing along the work, which he thought would be complete some time in October.

TENDERS FOR N.T.R. QUEBEC SHOPS.

AT a recent meeting of the Quebec city council, the clerk read the following letter from Mr. Leonard, of the National Transcontinental Railway:

Ottawa, July 3, 1913.

His Worship, Mayor Drouin, Quebec, P. Q.

"Dear Mayor Drouin, I beg to acknowledge receipt of your letter of the 27th June, and in reply would call your attention to the official letter sent you by this Commission on June 6th, which was delivered to you on June 11th by Mr. Fraser, and which I note, was read at a meeting of your council on June 13th.

"Work was commenced on June 27th draining the St. Malo site for the proposed shops ,and is being carried on at present. Final details preparatory to calling for tenders for the construction of the shops are now under way, and these tenders will be advertised for probably within a couple of weeks.

"As a preliminary to the rearrangement of the yard at the Palais Station, and the construction of the new Union Station on that site, you will probably have noticed that the C.P.R. is laying a number of new sidings just west of the proposed lay-out, which will be necessary for use during the carrying out of the work.

"The agreement as between the city council and this Commission governing these matters, is being prepared.

"Trusting this will give you the desired information, I remain, yours very truly,

R. W. LEONARD."

Mayor Drouin informed the council that since the reception of this letter, Mr. Fraser, the engineer of the Transcontinental, had submitted the contract of their Quebec works to him, and the contract had been submitted to the city attorneys, who had sent it to Ottawa. He expected that the contract would be sent to him in a few days for his signature. Mr. Doucet, the company's engineer, had informed him that the specifications would be ready in a few days, and he had received instructions to call for tenders for the workshops as soon as the plans and specifications were ready, and the contract signed between the city and the National Transcontinental Commission.

CANADA'S TRADE.

CANADA'S total trade for 12 months ending April, 1913, as published in a bulletin by the Department of Trade and Commerce, and summarized by The Globe correspondent, was $1,079,934,018, a splendid increase compared with the like period preceding, when the total was $879,611,838. The total imports were $678,587,617. Exports were $401,346,401. The amount of duty collected was $115,641,977.

One of the most interesting items in the list of imports is settlers' effects brought in by immigrants. During the twelve months ending April 30 this year the value of these from the United States $10,296,265, as compared with $4,900,274 from Great Britain.

Imports From United States.

The figures show in a comprehensive way the striking increases in the imports and exports which have already been reflected in monthly reports. A noteworthy feature is the increase of imports from the United States. Imports from that country during the twelve months were valued at $442,213,343, an increase over the preceding period of over seventy-five million, or about 18 per cent., and of more than 100 per cent. over the twelve months which ended April 30th, 1910. The total British imports for the year ending with April, 1913, also showed a satisfactory increase, being $140,177,842, nearly twenty-two millions, or 17 per cent. increase over the preceding period.

Increase Also in Exports.

Exports also show a satisfactory increase in the report. For the twelve months to the end of April, 1913, the total was $401,340,401. For the corresponding period of the previous year it was $318,919,890. For 1913 the exports to the United Kingdom were $183,734,820. To the United States they were $168,605,800.

* * *

Victoria, B.C.—The Steveston branch of the Canadian Northern Railway, which is now almost completed, will probably be operated by gas-electric locomotives.

IT would be idle, at the present time, to deny that money is not circulating as freely as it has been for the past four or five years.

¶ Money has undeniably been tighter than usual and no one seems to have been able to put a finger on the cause and define it. Some attributed it to the trouble in the Balkans and uneasiness concerning the outcome, while others say the present stringency arises from a general and quite natural slowing up: that there is no specific reason for it, and that the condition will disappear as it came—gradually.

¶ There is a strong feeling of confidence among leading business men and trade continues normally good with the more aggressive houses—abnormally good with some.

¶ Optimism is gaining ground and will ripen with the crops. In authoritative circles the impression prevails that the present stringency is passing and that the silver lining is in sight.

¶ Speaking in Ottawa, on July 26th, the Rt. Hon. Thomas Lough, representing the Empire Parliamentary visitors, said of Canada's financial outlook that: "The great natural resources of the Dominion are her greatest asset, and this year the logs will come down the rivers, and the grain in ships down the waterways and on the railways and her prosperity this year will be greater than ever." Mr. Lough considered that the present trip of the party will result in a great influx of English capital in the future.

¶ Business, as we have already remarked, continues strong with many manufacturers. One of the leading makers of Power Plant Equipment said last week that he had sufficient business booked and in sight to keep his plant going night and day for five or six months.

¶ Another manufacturer in a similar line of business was in much the same situation, and both predicted a speedy dissipation of the tight money cloud.

¶ The manager of one of the largest machinery manufacturing houses in Canada said to us the other day: "Money is a little tight, to be sure, but we are confident that it is only a temporary cloud and will soon disappear. *We are going after business a little harder; our salesmen are raking the country more aggressively, and we are helping them by increasing our advertising.* As a result business is coming in even greater volume than at this period last year and we are decidedly optimistic about the future."

¶ Get those words in italics, read them again, because they voice the secret of business success in tight-money-time, hot-weather time or any old time.

¶ Aggressive management, aggressive salesmen, and aggressive advertising, and back of it all, the spirit of optimism, and you have a combination that will win every time and all the time, and beat any tight money bogie that ever happened.

¶ Go after business hard from now on. Encourage and enthuse your salesmen. *Advertise freely and make your message cheerful.* An investment in good, sound advertising will not only help you wonderfully in getting business now, but it will come back, heaped up and running over, when money circulates with its old-time freedom.

¶ The future is bright, and if everybody will spread the spirit of optimism, everything will be rosy in a very short time. The best way to inspire confidence is to preach it.

¶ Loose talk about tight money is largely the cause of it.

Canadian Machinery & Manufacturing News

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Guelph, Ont.—Operations have begun at the Malleable Iron Works. About 120 men are already at work. So far one or two heats in malleable iron have been run off.

Hamilton, Ont.—John R. Nye, of Chicago, is proposing to organize a company to manufacture machinery for making artificial gas for heating and lighting purposes.

Orillia, Ont.—A fire occurred on July 26 at the old foundry of the E. Long Manufacturing Co. The pattern house and large storage shops and wooden buildings were destroyed.

Toronto, Ont.—Because of the tariff restrictions which, they claim, almost prohibit the exportation of electrical heating apparatus from the United States to Canada, the Hot Point Electric Heating Co., which now has its central plant at Ontario, Cal., will immediately build a large branch manufacturing plant at Toronto. Announcement to this effect was made on July 25, by Willis Booth, president of the company. The Canadian plant of the Hot Point Electrical Heating Co. will cost $250,000, and employ between 150 and 200 persons.

Sydney, N.S.—The Sydney Foundry and Machine Works, Ltd., recently installed punch and shears, electric traveling crane, electric forges, structural steel saw and a large air compressor.

Welland, Ont.—The directors of the Supreme Heating Company met last week, and decided to make extensive additions and improvements this fall to cost in the neighborhood of $10,000. The moulding department will be enlarged, and a new warehouse erected. At present about thirty hands are employed, and this staff will be doubled. Eight stoves are turned out daily and as this is below the demand the directors felt that an early start on the additions contemplated would be advisable.

St. Thomas, Ont.—The people will be asked to pass upon a by-law to establish a motor truck factory in the city. The findings of the special committee, who went to Findlay, Ohio, to investigate the conditions governing the property of Mr. Ewing, were of a satisfactory character, and a recommendation followed by the committee that the question of guaranteeing the bonds of the proposed company to the extent of $125,000 be given the ratepayers. The building to be put up in St. Thomas will cost $50,000, the land probably $5,000, and, with the capital subscribed by local parties to the extent of $50,000, the machinery and raw material will make up the difference. The factory will employ 300 skilled men at the end of six months, with wages ranging from 25 to 60 cents an hour. The industry will be equipped to manufacture parts of auto machinery, as well as the making of trucks.

Toronto, Ont.—Cluff Brothers, the plumbing supplies' firm, recently completed the purchase of the premises owned and formerly used by the General Brass Co. on Sterling Road, near the C. P. R. tracks, in the north-west of the city, for $50,000. A new company is being formed to be known as the Cluff Manufacturing Co. who will manufacture plumbing supplies, and the newly-bought factory will be occupied by them. The General Brass Co. ceased operations two years ago, but held their charter, and several assets, among which the Sterling Road property was one. They sold part of their machinery some time ago. The site in question has a frontage of 205 feet on Sterling Road, and is 185 feet deep. About 60 feet of its width is vacant of

buildings. At present the new owners will only use the building which now occupies the ground, but they expect to expand their factory later.

Electrical

Medicine Hat, Alta.—City Engineer Grimmer has been authorized to place an order for six 500-kilowatt transformers. A total voltage of 13,000 will be installed.

Grenfell, Sask.—The citizens have adopted a by-law to raise $15,000 for installing a civic electric plant. The contract has been let and it is hoped to have the plant in operation by Oct. 1.

Galt, Ont.—On the suggestion of Dr. W. S. Dakin, Chairman of the local Hydro-electric Commission, the City Council will consider the purchase of a pulmotor the cost to be shared by the town and the Hydro Commission.

Regina, Sask.—The experimental station at Estevan which is being established by the Provincial Government will be finished in August, and it will then be possible to complete the investigation into the power-producing possibilities of Estevan coal.

Weston, Ont.—Weston Water and Power Commission have planned to make considerable extensions outside the town. Etobicoke and York townships are the territory in question. A. G. Pierson, secretary of the Commission, has prepared an estimate, and the probable cost will be $13,000. About 400 poles and 10 miles of wire will be necessary. The extension in York will be made to Downsview.

Hydro-Electric Power.—Cannington, Beaverton, and other municipalities in this district will have Hydro power in their factories soon. The Provincial Commission has awarded the switching and transformer equipment contract to the Westinghouse Co., and the contract for supplying generators to the European house of the Kilmer-Pullen Co. The power will be obtained from Wasdell Falls, North Orillia township, Simcoe County, and Galbraith & Co., of Montreal, are constructing the necessary dam.

Newcastle, N.B.—Newcastle is to be the Atlantic terminus of the Universal Radio Syndicate, which will establish a wireless service from Britain to this town as a link in an all-British world encircling service. A Montreal concern has contracted to build and instal the plant. The steel tower will be 500 feet high. It is being constructed in England and will be shipped out in sections. Round this central tower will be grouped six other towers, each one hundred feet high, connected by copper wire with the central tower. The president of the syndicate is A. Baxendale, consulting engineer; and Dr. Erskine Murray, Glasgow, Scotland, with Dr. Poulsen and Prof. Peterson, technical directors.

Welland, Ont.—A new transformer house for the Hydro-Electric will be erected on Queen Street. This is required for the increased load used by the Canada Forge Works. It will be fed direct from the new line from Niagara Falls and will be in operation before the snow flies. The new line from Niagara Falls direct to Welland is now being built and a primary line is being built to Turnbull's brick yard, where electricity is being installed instead of gas, and the machinery will be operated by electric power. The brick will also be dried by electricity.

Negotiations are now on for a contract for 6,000 horse-power for the new electric smelter to be erected on the site of the brick yard.

Wood-Working

Fort William, Ont.—Hymers Bros.' sawmill at Hymers, Ont., was burned to the ground on July 23, with 30,000 feet of choice lumber. The loss at the mill alone was $30,000, and there was no insurance.

Building Notes

Toronto, Ont.—A permit has been issued to J. G. Discon for an apartment house at St. Clair and Glenbro Avenues to cost $11,000.

Toronto, Ont.—A permit has been issued to Sproat & Rolph, architects (in trust) for a five-storey brick building at Richmond and Peter Streets to cost $50,000.

Municipal

Port Coquitlam, B.C.—The city will spend $10,000 for fire apparatus.

Rivers, Man.—The town is spending $8,000 for additional fire protection.

Quebec, Que.—Four motor tractors for the Quebec Fire Brigade arrived at the end of last week.

Orillia, Ont.—A by-law to authorize a loan of $25,000 to the C.N.W. Shoe Co., was carried on July 21. The company will begin to build at once, and hope to be ready for business by October 1.

Hull, Que.—Debentures to raise the amount of $77,700 for the extension of the waterworks system through suburban districts of Hull, have been issued by the Hull city council. The work will commence shortly.

Toronto, Ont.—According to the proposition submitted last week to the members of the city council by the Bell Filtration Co., through Mr. H. W. Cowan, its chief engineer, the company undertakes to build a mechanical filtration plant on the mainland adjoining the main pumping station at the foot of John Street. The Bell plant, manufactured in Manchester, England, would have a minimum capacity of 65,000,000 gallons and a maximum of 96,000,000.

The Bell proposition contemplates that the present $800,000 plant be retained for use as a basin to effect settlement of the water before filtration.

Tenders

Brighton, Ont.—Tenders will be received by B. H. Mahoney, Guelph, for the construction of a factory, owner's name of which has not been revealed.

Vancouver, B.C.—Tenders for the supply of 3,750 feet of 18-inch cast iron flexible pipe for the False Creek submerged main will be called for shortly by the City Commissioners.

Contracts Awarded

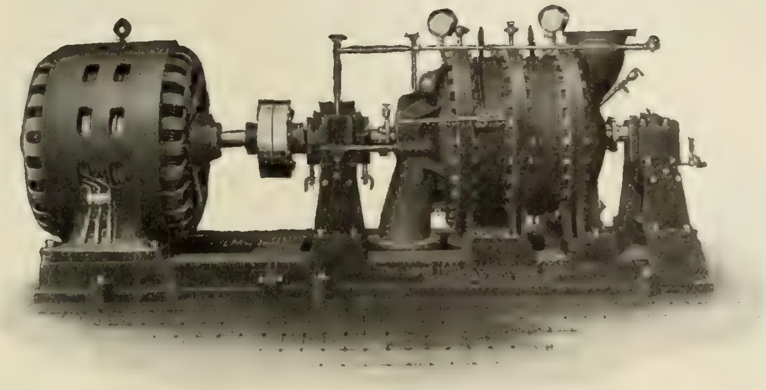
Ottawa, Ont.—The contract for the new postal station "G" for Toronto was let by the Government on July 17. The building will be erected at Queen and Saulter Streets, and will cost $126,214. Witchall & Son are the builders. Other Ontario contracts awarded were: Public building at Preston, to Geo. E. Proctor, at a price of $44,861. Public building at Shelburne. The contractors are Alex. Greer and W. A. Campbell, and the cost will be $39,707. Public building at Elmira. The contract goes to E. A. Bleakney, and the cost is to be $35,000. Dredging at Killarney. The contractor is the C. S. Boone Dredging Company, and the amount of the work is $8,000.

Water Works

Halifax, N.S.—The city is borrowing $300,000, among other things for sewer construction, costing $152,500, and extension of water system, costing $50,000.

New Liskeard, Ont.—The waterworks, for which tenders were called, will not

TURBINE PUMPS



"INGLIS" Turbine Pumps give the best results, because they represent the best in Engineering Skill, Workmanship and Design. :-: :-:

THE JOHN INGLIS COMPANY LIMITED

Engineers and Boilermakers

14 Strachan Avenue, Toronto, Canada

A. ANGSTROM, Montreal Representative; Room 509 Canadian Express Building.

be erected until debentures are sold. The tenders were thrown out, and the cheques returned.

Edmonton, Alta.—By-laws to authorize debentures for municipal expenditures of $2,340,400 have passed their final reading. These include $519,760 for waterworks, and $1,692,149 for sewer extensions.

Toronto, Ont.—Allen Hazen, of Hazen & Whipple, New York, will probably design the city's new million-dollar mechanical water filtration plant to be constructed on Toronto Island. Toronto cannot engage anyone else if it wants to, according to an agreement entered into with Mr. Hazen on August 8, 1912, when the municipality agreed with Mr. Hazen that he should be retained to give expert advice in connection with the construction of future extensions of the filtration plant. Mr. Hazen has written to the city reminding them of the agreement and intimating that he expects to have charge of the plans for the new plant the City Council voted recently to construct.

Railways—Bridges

Camrose, Alta.—It is the intention of the C. N. R. to lay steel on the C. N. R. grade, south-west of Camrose.

Welland, Ont.—The new branch of the N. S. & T. Railway, from St. Catharines to Niagara-on-the-Lake, will be opened about October 1st.

Toronto, Ont.—The C. P. R. will immediately commence operations for the construction of an electrical road from Hamilton to Niagara Falls.

Nelson, B.C.—On July 29th the ratepayers voted on a by-law to authorize the corporation to guarantee the payment of $40,000, being a mortgage debenture issued by the Nelson Street Railway Co., Ltd.

Toronto, Ont.—According to the plans now prepared by Assistant City Engineer Powell, the city will expend $3,000,000 next year in bridges. The Bloor Street viaduct is the chief work planned and will consume a large amount of the sum named. The Gerrard Street bridge, the C. P. R. viaduct, Poplar Plains Road, Avenue Road and other bridges of less importance, make up the balance.

Ideas at Two Cents Each

¶ An idea that's worth anything at all to a Mechanical man is worth more than two cents.

¶ It might be worth hundreds of dollars.

¶ Every issue of "CANADIAN MACHINERY" is full of practical, helpful ideas. You ought to be able to sift out four each month that would prove of some use to you. Put a value of two cents on each and your subscription has been paid.

¶ You cannot afford to miss even one issue—you might miss the idea that would be worth hundreds of dollars.

¶ The date on the label of your "CANADIAN MACHINERY" wrapper shows when your subscription expires. One dollar will renew it for a year.

Don't put off Renewing—Do it to-day

Marine

Ottawa, Ont.—The Dominion Dredging Company of Ottawa is arranging to start work on section one of the new Welland Canal, within the course of a few weeks. The company is one of the best equipped in the business, having a fleet of dredges of large capacity, being contractors for the big harbor works at Quebec. The equipment will be taken up to the Welland Canal from the Quebec yards of the company at once, and the work started with a view to early completion.

Ottawa, Ont.—The Marine Department has ordered a large dredge to be used in addition to those already operating on the north channel below Quebec from St. Jean, Ile d'Orleans, to Goose Cape. A total of eighteen million yards of material will have to be removed, and three million have been taken out so far. The channel is to be thirty-five feet deep, and will be much easier to navigate than the southerly one. Its construction has long been urged by the Quebec Board of Trade and other similar bodies.

Trade Gossip

Capital Increased.—The capital of The Barcelona Traction Light & Power Co. Ltd., has been increased from $30,000,000 to $42,500,000. The capital of the Standard Iron Co. Ltd. has been increased from $100,000 to $300,000.

Change of Name.—The corporate name of the Beauharnois Machinery Co. Ltd., has been changed to The Berthier Machinery Co. Ltd. The name of the Sorel Iron Works, Ltd., has been changed to The Oxford Motor Cars and Foundries, Ltd.

The De Grasse Paper Co. in conjunction with the New York World, have purchased from Mr. D. H. Pennington, of Quebec, his pulp wood limits at Murray Bay, comprising 52,000 acres. The price paid was $400,000. Mr. Pennington, has taken a contract to cut 50,000 cords of wood off the limits annually for the purchasers.

Boving & Co., of Canada, Ltd., who recently acquired works at Lindsay, Ont., for manufacturing high-class hydraulic machinery, have been awarded the contract for large turbines and governors by the Hydro-Electric Power Commission of Ontario for the Wasdells Falls on the Severn River. These units will be of similar size to those recently supplied by Boving & Co., of Canada, for Dams Nos. 2 and 5, in the Trent River, which have a combined capacity of 10,000 horse-power.

Personal

J. C. Strickland, formerly of the Massey-Harris Co., Toronto, has been appointed superintendent of the Supreme Heating Co., Welland.

Alfred J. Jones, Montreal, has been appointed Canadian agent for Hick-Hargreaves & Co., Ltd., of Bolton, Eng., who have commenced the manufacture and sale of Diesel oil burning engines.

Willis Chapman, civil engineer, of Toronto, who has been engaged by the mayor of Edmonton, Alta., to give the city his opinion on the various water supply propositions now before the city, arrived there July 21.

A. C. Towne has succeeded C. B. Ellis as manager of the electrical department of the Montreal branch of the Canadian H. W. Johns-Manville Co. Mr. Towne was formerly foreman of the electrical branch of the C. P. R. Angus shops.

T. J. Wilkinson, formerly of the Harvest Tool Co., Montreal, who left to take up an important position with the Nova Scotia Car Co. at Halifax, has returned to Montreal, and is now travelling representative of E. H. Drury & Co., wholesale steel merchants.

Thomas Burns, who has been assistant construction engineer of the Hydro-Electric Co., Prince Rupert, B.C., has been offered a position by the Ontario Hydro-Electric Power Commission as superintendent of the waterworks and lighting department at Midland, Ont.

Sir Alex. A. Binnie, the well-known London, Eng. civil engineer who was engaged by the city of Ottawa to report on the water supply has been obliged to relinquish the appointment on account of ill-health. Binnie & R. S. Tickell have been appointed to take care of the work.

Charles B. Ellis has been appointed manager of the Economy Fuse and Manufacturing Co. of Canada, with offices and warehouse in the Herald Building, Montreal. The Economy Fuse and Manufacturing Co. are organizing branches in the larger cities of the Dominion.

A. E. Hoare, C.E., Quebec, formerly chief engineer of the Quebec Bridge Co. and many other important public works during the past fifteen years in the vicinity of Quebec, has been appointed by the Dominion Government engineer to take charge of the work of building the new Levis dry dock, and also on behalf of the government to superintend the damming of the river St. Charles.

FILES OF QUALITY

The DELTA

Is the only Line of Files from 3 to 24 inches that are made absolutely of CRUCIBLE STEEL

You will find "Delta Files" invaluable, because they will stay sharp longer than any other file, and remove stock rapidly.

The minute you start to use these files you will know the difference and appreciate it.

The exceptional service giving qualities are due directly to the use of Crucible Steel and the great care and expert skill used in hardening and tempering.

"Delta Files" are made in several shapes and sizes so as to meet all requirements.

Cut represents a Hand Utility made of high Carbon Crucible Steel, specially hardened and tempered, cuts rapidly and smoothly, clears freely. For use on metal, soft steel, iron, brass castings, wood babbitt, marble, etc. An ideal file for every machine shop.

Catalogues

Wm. & J. G. Greey, Toronto, have sent us a copy of catalog M. 2, which illustrates and describes the various types of trucks and express wagons, which they handle. Flour Mill machinery is also included.

The Osborn Mfg. Co., Cleveland, Ohio, has issued the July number of the "Merry Moulder," which is called the "Birthday Number." This is the anniversary of this publication, and it certainly seems to improve with age.

The Armstrong Bros. Tool Co., Chicago, have sent us a copy of their latest catalog No. 2, in which is listed a complete line of high grade drop forged wrenches. All types are illustrated and full dimensions given for each size.

The Garvin Machine Co., New York, have sent us a copy of their new circular No. 200, descriptive of the "Garvin" duplex horizontal drills. Each size is clearly illustrated and a specification covering the principal features is included.

Catalogues

"The Successful use of Cling-Surface in Railroad Shops"—An 8-page booklet issued by the Cling-Surface Co., Buffalo, N.Y. It illustrates noteworthy examples of the benefits of Cling-Surface in five prominent railroad shops, and describes every installation in detail. On the last page over 40 big railroads are listed which use this treatment. A free copy will be sent on request .

The United States Graphite Co., Saginaw, Mich., have sent us a new booklet entitled "What Users Say About It." This is a handsome production, and contains much interesting information relative to Mexican boiler graphite, its use with boilers, effect on scale and its prevention. Several pages are devoted to testimonials from users in all parts of the United States, who have different conditions to contend with. These are arranged alphabetically and indexed.

Case Hardening.—We have received from the Ideal Case Hardening Compound Co., New York, an interesting publication entitled "Case Hardening and Heat-Treating of Steel." This is the fifth edition of a book of 38 pages, and contains some valuable information on the treatment of steel and method of case-hardening, also a number of practical rules covering these subjects. The various constituents and alloys of steel are described and their use explained. Copies will be sent to interested readers.

The L. S. Starrett Co., No. 20 catalog is among the most complete catalogs of mechanics' fine tools yet printed. Year by year, the Starrett Co. has built up its catalog until this, the 20th edition, is a large book in itself. It will contain some 320 pages (46 more pages than in No. 19) of interesting descriptions, illustrations, and prices for all kinds of tools for mechanics, carpenters, draftsmen, engineers, chaffeurs, and other mechanics. In addition, there will be many pages of data and tables such as metric conversion tables, decimal equivalents, weight computing tables, tapers and angles, wire gauge tables, etc. The arrangement of the catalog has been somewhat changed from that of No. 19, which makes it easier for reference. Several important additions of tools to the Starrett line are shown in the new catalog.

* * *

A GOOD record of consistent operation is reported from the Dome Mines, South Porcupine, where two Robb Corliss Engines, during the last year, ran several months without stopping, with the plant operating 99 per cent. of the total possible time.

GRAPHITOL

Pat. and Trade Mark Reg'd.

"Graphitol" is a graphite powder and liquid which, in combination, embody the cement principle applied to the production of a lubricated bearing material of hardness and durability.

No heating is required, and the mixture sets in a reasonable length of time.

Graphitol bearings require less lubricant, as the material is to a high degree self-lubricating, in addition to which it absorbs oil and feeds it evenly over the entire bearing surface without waste.

The heat resisting properties of graphite are well known.

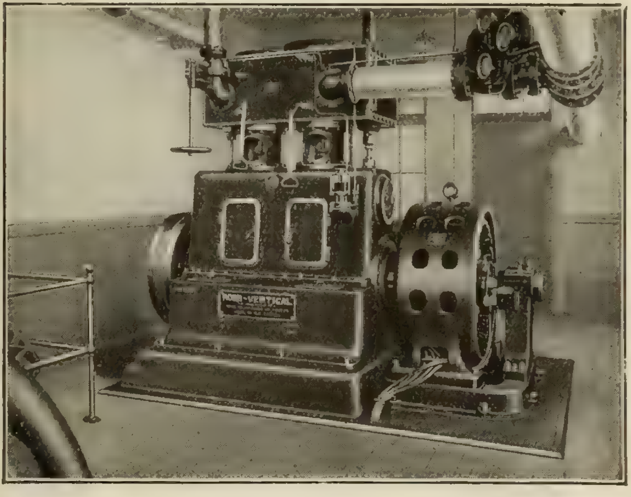
CONFIDENCE—



THE machines in your power-house, whether a central station, isolated plant, or factory, are to last a life-time—they should be the best you can buy. You won't have confidence in them unless they are the best.

Your engine—you have no confidence in a new freak design—you want one of tried service. The

ROBB ENGINE

is not a radically different construction, but a well-designed, finely-built engine having many thoroughly tried features of marine practice adapted to electrical service and stationary work. Robb vertical compound engines are short stroke and of the high speed for direct connection to generators, turbine pumps, etc. They are entirely enclosed and self-lubricating — in short, have all those features which contribute to Robb service.

Morse Twist Drill and Machine Company

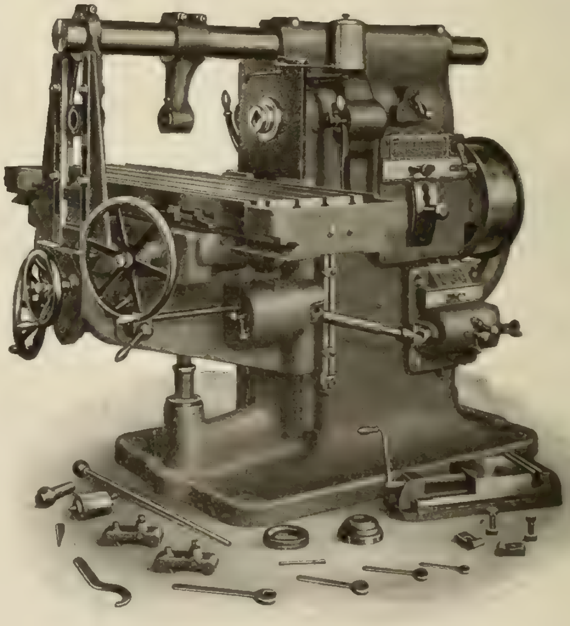
NEW BEDFORD, MASS., U.S.A.

"Morse" Drills and Tools are handled by:—Rice Lewis & Son, Limited, Toronto; Aikenhead Hardware, Limited, Toronto; Frothingham & Workman, Montreal; Mechanics Supply Co., Quebec.

Pulley—20" Diam., 7" Belt, 320 R.P.M.

No. 5B Heavy Plain Milling Machine

Capacity—50" x 12" x 21"



The great power delivered to the pulley is transmitted through strong spur gearing to the **front** of the spindle, where it is always available for heavy cuts common on a machine of this size. Massive design of all parts insures accuracy in work produced and long service in continuous manufacturing. These features command your attention if interested in a heavy service milling machine.

Write for special circular.

"PEERLESS" HIGH SPEED REAMERS

Service Can be run at double the speed of carbon steel reamers and at that speed will do two or three times as much work without regrinding. They increase the output and at the same time reduce the manufacturing costs.

Cost "Peerless" High Speed Reamers cost you only about half as much as the ordinary high speed reamer because of their special construction.

Construction Blades of finest quality selected high speed steel are joined by our patented "Brazo-Hardening" Process into one solid piece with a special tough steel body.

Guarantee The blades will never come loose. To make this assurance doubly strong we agree to **replace** FREE any "Peerless" reamer giving evidence of such a defect. That's a liberal enough guarantee to make you interested in full details. **Write for Catalog No. 36-C.**

We illustrate here our 8-inch Precision Lathe equipped with Spiral Attachment and Traverse Milling Attachment.

It is mounted upon a handsomely finished quartered oak cabinet, which has been especially designed to make this lathe with its great variety of attachments, a complete, self-contained unit. This lathe has a world-wide reputation, and is used by scientists, experimenters, model makers, and in technical schools, laboratories, observatories, and tool rooms, all over the world.

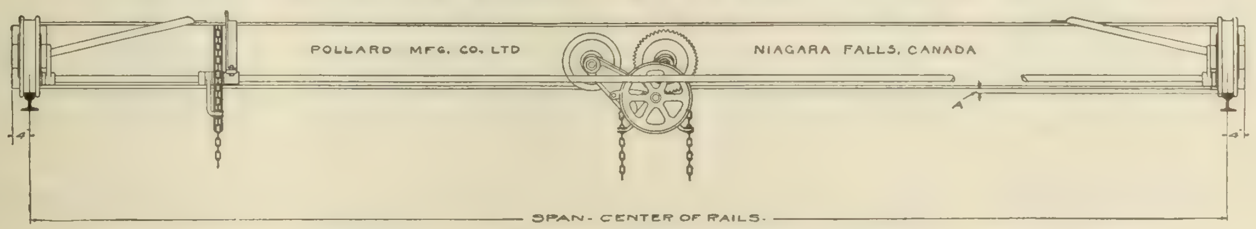
I BEAM HAND POWER CRANES



Roller Bearings—Long Wheel Base—Large Wheels—Minimum Friction—Easy to Operate.
Two to Five Ton Capacity—Ten to Thirty Foot Span.

POLLARD MANUFACTURING CO., LTD., NIAGARA FALLS, CANADA

Not an Enterprise for the "Quitter"

¶ "If there is one enterprise on earth," says John Wanamaker, "that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick like a barnacle on a boat's bottom.

¶ "He must know before he begins it that he must spend money—lots of it.

¶ "Somebody must tell him that he cannot hope to reap results commensurate with his expenditure early in the game.

¶ "Advertising does not jerk; it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year, until it exerts an irresistible power."

TWO CENTS PER WORD

You can talk across the continent for two cents per word with a WANT AD. in this paper

Tool Steel.
Herman Boker & Co., Montreal.
Can. Fairbanks-Morse Co., Montreal.
Thos. Firth & Sons, Montreal.
Alexander Gibb, Montreal.
Mussens, Limited, Montreal.
National Mach. & Sup. Co., Hamilton.

Tools, Blacksmith's.
Can. Buffalo Forge Co., Montreal.

Tools, Electrical.
Can. H. W. Johns-Manville Co., Ltd., Toronto.
Mussens, Limited, Montreal.

Tools, Lathe, Planer and Slotter.
Armstrong Bros. Tool Co., Chicago.
Charles H. Bealy & Co., Chicago.
Peacock Bros., Montreal.
Rivett, Lathe & Grinder Co., Boston, Mass.

Torches, Steel.
Detroit Foundry Suply Co., Windsor.
Stevens, F. B., Detroit, Mich.

Track Tools.
Can. H. W. Johns-Manville Co., Ltd., Toronto.
Can. Fairbanks-Morse Co., Montreal.

Transformers and Converters.
Can. Fairbanks-Morse Co., Montreal.
Can. Westinghouse Co., Hamilton.
Hall Engineering Works, Montreal.
T. & H. Electric Co., Hamilton.

Transmission Machinery.
Can. Fairbanks-Morse Co., Montreal.
Can. Drawn Steel Co., Hamilton, Ont.
Dodge Mfg. Co., Toronto.
Hamilton Gear & Mach. Co., Toronto
John Inglis Co., Toronto.
Jones & Glassco, Montreal.
John Millen & Son, Ltd., Montreal.
Morse Chain Co., Ithaca, N.Y.
Mussens, Limited, Montreal.
The Smart-Turner Machine Co., Hamilton.
Jenckes Machine Co., Ltd. Sherbrooke, Que.

Transmission Towers.
Can. Bridge Co., Walkerville, Ont.
Canadian Ingersoll-Rand Co., Ltd., Montreal.
Curtis & Co. Mfg. Co., St. Louis, Mo.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Toronto.

Tallman Brass & Metal Co. Hamilton
Lumen Bearing Co., Toronto.
John Millen & Son, Montreal.
Northern Crane Works, Walkerville.

Trucks, Lumber and Kiln.
John Inglis Co., Toronto.
Sheldons, Ltd., Galt, Ont.

Trucks, Factory, Freight, Etc.
Can. Automatic Transportation Co., Welland, Ont.

Tubes, Boiler.
John Millen & Son, Montreal.

Tubes, Seamless.
Charles H. Bealy & Co., Chicago.

Tube Expanders (Rollers).
A. B. Jardine & Co., Hespeler.

Turbines, Steam, Water.
Can. Buffalo Forge Co., Montreal.
John Inglis Co., Toronto.
Peacock Bros., Montreal.
Can. Westinghouse Co., Hamilton.
International Engine Works, Ltd., Amherst, N.S.

Turnbuckles.
Canadian Billings & Spencer, Ltd., Welland.
Can. H. W. Johns-Manville Co., Ltd., Toronto.

Turret Machines.
Pratt & Whitney, Hartford, Conn.

Upsetting and Bending Machinery.
John Bertram & Sons Co., Dundas.
Can. Buffalo Forge Co., Montreal.
Canada Mach. Corp., Galt, Ont.
A. B. Jardine & Co., Hespeler.
Mussens, Limited, Montreal.
National Machy. Co., Tiffin, O.
Niles-Bement-Pond Co., New York.

Vacuum Pumps.
John Inglis Co., Toronto.
Peacock Bros., Montreal.

Valve Grinders (Pneumatic).
Cleveland Pneumatic Tool Co. of Can., Toronte.

Valves, Back Pressure, Steam.
Hare Eng. Co., Toronto.
Sheldon's, Limited, Galt.

Ventilating Apparatus.
Can. Buffalo Forge Co., Montreal.
Sheldon's, Limited, Galt.

Vises, Bench.
Chas. Parker & Co., Meriden, Conn.
National Mach. & Sup. Co. Hamilton.
Prentiss Vise Co., New York.

Vises, Pipe.
Armstrong Mfg. Co., Bridgeport, Conn.
Chas. Parker & Co., Meriden, Conn.
General Supply Co. of Can., Ottawa.
National Mach. & Sup. Co., Hamilton.
Prentiss Vise Co., New York.

Vises, Planer and Shaper.
National Mach. & Sup. Co., Hamilton.
Skinner Chuck Co., New Britain, C.

Vises, Milling Machine.
National Mach. & Sup. Co., Hamilton.
Schuchardt & Schutte, Montreal.

Washer Machines.
National Machy. Co., Tiffin, Ohio.

Waste and Wipes.
Dom. Waste Mfg. Co., Toronto.
Imperial Belt. & Sup. Co., Montreal.

Waterproof Coating, Cement, Fabric.
Can. H. W. Johns-Manville Co., Ltd., Toronto.

Watchman's Clocks.
General Fire Equipment Co., Toronto.
Can. Buffalo Foige Co. Ltd. Montreal

Welding, Acetylene and Oxygen
L'Air Liquide Society.

Welding Compounds.
Phillips-Laffitte Co., Philadelphia.

Welding Machines, Electric, etc.
Agnew Electric Welder Co., Walkerville, Ont.
Toledo Electric Welder Co., Cincinnati, O

Wheelbarrows.
Detroit Fundry Supply Co., Windsor.
Mussens, Limited, Montreal.

Winches.
John H. Hall & Sons, Brantford.
Mussens, Limited, Montreal.

Window Wire Guards.
Canada Wire & Iron Goods Co., Hamilton.
B. Greening Wire Co., Hamilton, Ont.
Geo. B. Meadows Co., Toronto.

Wire, all kinds.
Northern Bolt & Screw Co., Owen Sound.
Steel Co. of Canada, Hamilton.

Wire Chains.
B. Greening Wire Co., Hamilton, Ont.

Wire Cloth and Perforated Metals
Canada Wire & Iron Goods Co., Hamilton, Ont.
Dennis Wire & Iron Works Co., Limited, London.
B. Greening Wire Co., Hamilton, Ont.

Wire Forming Machinery.
F. B. Shuster Co., New Haven, Conn.

Wire Guards and Railings.
Canada Wire and Iron Goods Co., Hamilton, Ont.
B. Greening Wire Co., Hamilton.
Geo. B. Meadows Co., Toronto.

Wire Nails.
Parmenter & Bullock Co., Gananoque
Steel Co. of Canada, Hamilton.
General Supply Co. of Can., Ottawa.

Wire Nail Machinery.
National Machy. Co., Tiffin, Ohio.

Wire Rope.
B. Greening Wire Co., Hamilton, Ont.

Wire Straighteners and Cutters.
F. B. Shuster Co., New Haven, Conn.

Wire Coiling Machines.
F. B. Shuster Co., New Haven, Conn.

Wood Boring Machines Pneumatic.
Cleveland Pneumatic Tool Co. of Can., Toronto.
Independent Pneumatic Tool Co., Chicago, Ill.
Mussens, Limited, Montreal.

Wood Split Pulleys.
Dodge Mfg. Co., Toronto.

Woodworking Machinery.
Can. Fairbanks-Morse Co., Montreal.
Mussens, Limited, Montreal.
Valley City Machine Works, Grand Rapids, Mich.

Wrenches.
Butterfield & Co., Rock Island, Que.
Canadian Billings & Spencer, Ltd., Welland.
Whitman & Barnes Mfg. Co., St. Catharines, Ont.

Wrenches, Automobile Narrow Jaw and Monkey.
Bemis & Call Hardware and Tool Co., Springfield, Mass.
Trimont Mfg. Co., Roxbury, Mass.

Wrenches, Pipe, Monkey.
Bemis & Call Hardware and Tool Co., Springfield, Mass.
Trimont Mfg. Co., Roxbury, Mass.
John Millen & Son, Montreal.

Wrenches, Ratchet and Basin.
Bemis & Call Hardware and Tool Co., Springfield, Mass.

This Is For You

¶ This directory is run solely for the convenience of buyers.

¶ It will connect you in a jiffy with the most progressive firms who have for sale the Machinery, Tools or Supplies you need.

¶ A manufacturer or a jobber who thinks enough of his line to advertise it publicly must have a good line.

¶ Consult "CANADIAN MACHINERY'S" Buyers' Directory, and you will connect with good concerns.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

Air Compressors.

SMOOTH-ON

TRADE MARK REG. U. S. PAT. OFF.

SMOOTH-ON
IRON CEMENTS
No. 1, No. 2 and No. 3

Permanently stop all leaks of steam, water, fire or oil, in iron or steel castings, boilers, tanks, piping, pumps, screw thread joints, flanged joints, etc.

Smooth-On No. 4 is unequalled for filling in blowholes in iron or steel castings.

The Smooth-On Cements are easy to apply and make permanent repairs, proved by years in use.

Every engineer should read our new No. 12 illustrated instruction book—FREE. It tells when, where and how to use the different Smooth-On Cements. Send for it now.

Books for Foundrymen

Three good Books that should interest Foundrymen who wish to know more about their work.

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price, ... $1.00

PATTERN MAKING. By G. H. Willard. To which are added chapters on Coremaking and Molding. 214 pp., 312 illustrations. Cloth binding Dealing with the practical experience of foundry work, tools required; woods adapted for the work; turning; and all kinds of patterns. Price, postpaid .. $1.00

CASTINGS

MANGANESE BRONZE CASTINGS

We have made a specialty of this material for years and can satisfy your rigid specifications. Our specifications 70,000 to 75,000 tensil strength.

20 per cent.—25 per cent. Elongation.

(Am. Soc. Testing Materials Methods.)

LUMEN BEARING COMPANY
Brass Founders
WEST TORONTO

STEEL CASTINGS

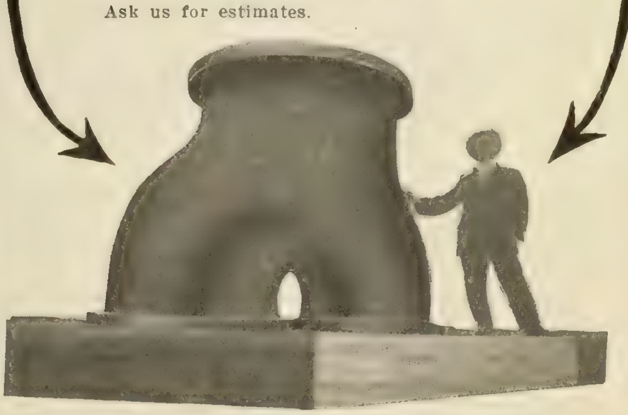
All Sizes, $\frac{1}{4}$ lb. to 30,000 lbs.

We make **New Process Converter Steel Castings, annealed and unannealed; also Chrome-Manganese and Nickel Steel Castings.**

Our castings are perfect, yet they can be procured at a price that will insure economy.

Every one guaranteed.

Ask us for estimates.



Casting for a 10,500 H.P. Water Wheel.

JOLIETTE STEEL CASTINGS WORKS, LTD.
Head Office and Foundry: JOLIETTE, P.Q.

A sign of good profits

FOR YOU--FOR EVERY FOUNDRYMAN

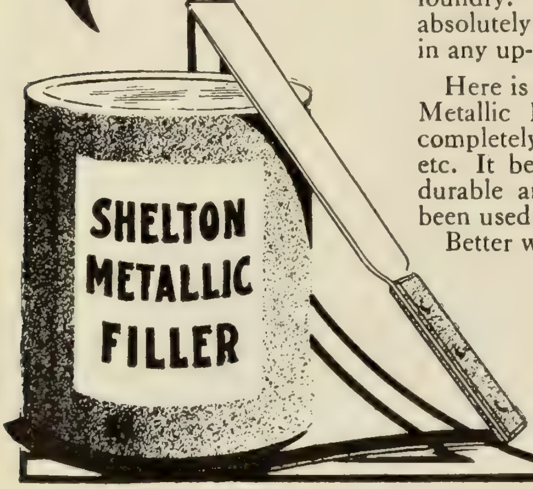
Shelton Metallic Filler

is a guarantee for *bigger results* in any foundry ---it eliminates *make-overs.*

Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years. Better write to us at once.

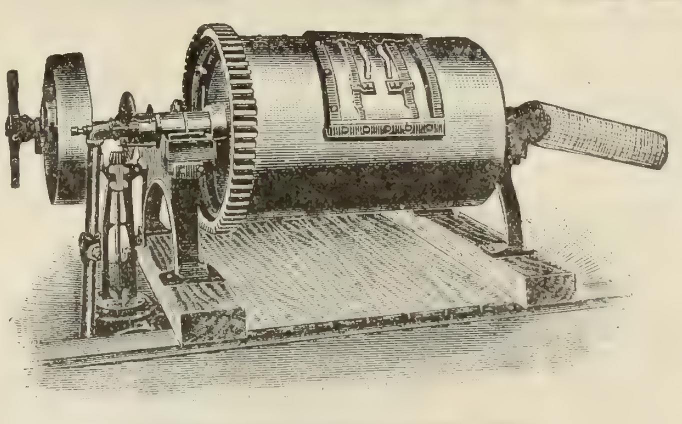
Every casting means a profit if you are a user of **SHELTON METALLIC FILLER** At a slight cost the "bum" casting can be made as good as the *best---don't throw it on the scrap heap.*



SHELTON METALLIC FILLER CO.
DERBY, CONN.

SAVE YOUR IRON

A GOLD MINE



SLY'S PATENT IRON CINDER MILL

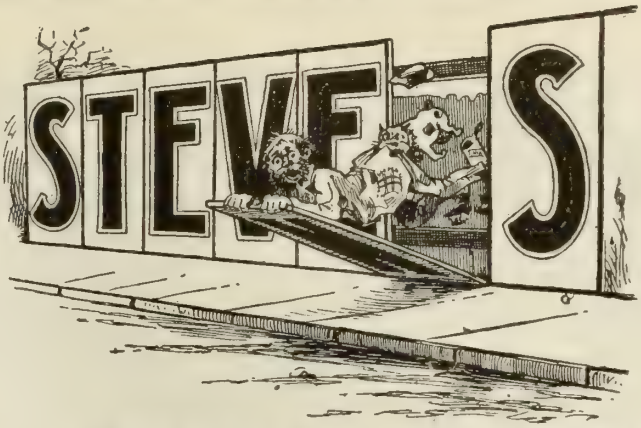
Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the iron contained in your cupola dump and gangway scrapings and 75% of the coke. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment

THE W. W. SLY MFG. CO., CLEVELAND, O.



THE MISSING LETTER

You know the beautiful, blue, smooth surface of a Casting is one of its essential qualities.

You know its appearance acts as a silent salesman for that same casting.

You know, also, that the cost is less when the Foundry produces this effect without the aid of the Scratch-room or the Chipping gang.

You, perhaps, know it is possible to procure a Plumbago-Ceylon Lead—that will produce that effect.

Perhaps in the mazes of substitutes sailing under a similar name you have forgotten that I import from Ceylon's Coral Strand just that kind.

Its cost is less—at the end.

The same high standard of excellence pervades, with pocket-book popularity, my entire line of Foundry Facings and Foundry Supplies.

If your letter of inquiry is not missing in my mail, I will tell you more about it.

FREDERIC B. STEVENS

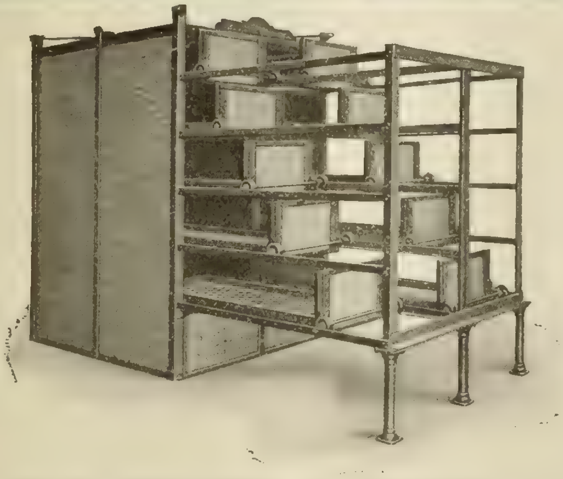
THE CRAWFORD SECTIONAL OVEN
PAT'D NOV. 20, 1906
THE OVEN EQUIPMENT AND MFG. CO. NEW HAVEN, CONN.



FOR CORE BAKING

An even, uniform heat is required. Where this is not provided, the cores come out poorly and many of them have to be made over again. Such troubles never happen with

Crawford Sectional Ovens

The heated air, forced by a positive pressure blower into every part of the oven, provides perfect circulation; while the temperature regulation is under close control. If the core is properly made when it goes into the oven, it will come out perfectly baked. Accurate results are assured by our patent

ENCLOSED FLAME GAS BURNER

These ovens are made for any size of work. Trays on roller bearings, used for small cores, make handling easy. As the oven is sectional, it may be made in any size and with any combination of arrangements for operating.

Let us figure on your requirements. Meantime, let us send you our booklet C.

The Lathe of Maximum Production

WE have put into this new Gap Lathe every feature that makes for economical production — speed in changing, accuracy of cut, quality of cut, and solidity of bed.

All parts taking strain are of ample excess size, and all bearings are large. The gap is solidly supported, and is of extra width and depth.

Correspond with us for full particulars. You can instal one or a battery of these machines in any size of gap within wide limits, and in any length of bed. Write us.

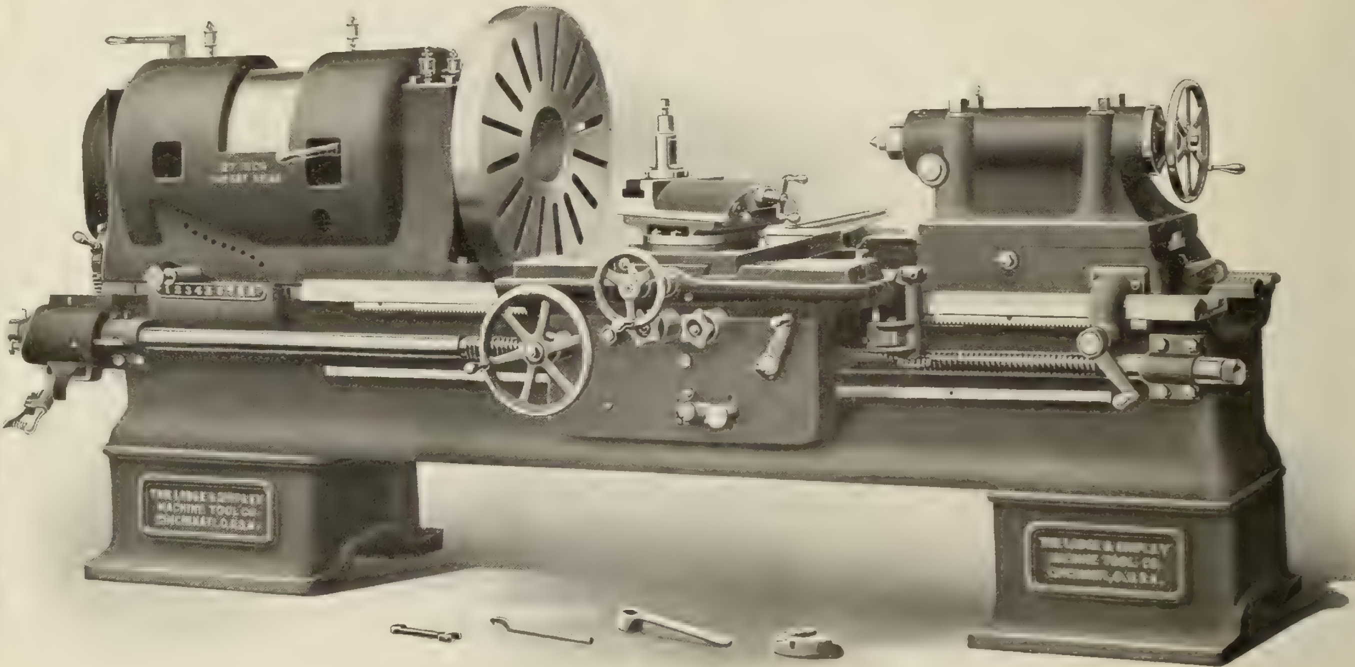
ENGINE LATHES

MANUFACTURED BY

The Lodge & Shipley Machine Tool Co.



24-inch PATENT HEAD ENGINE LATHE

The Patent Head driven by a large diameter wide face pulley combines the best qualities of both the cone-head and all-geared head. No pull of belt on spindle. No wear of sleeve on spindle. No slipping of belt.

Send us your inquiries and give us a chance to show you why the Lodge & Shipley Lathe is the best on the market.

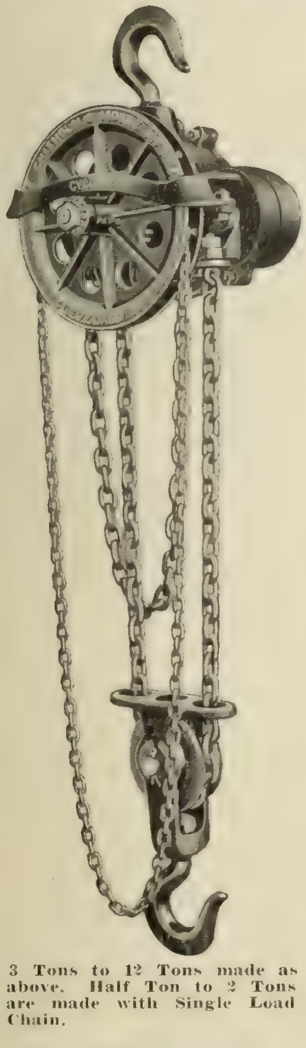
CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

MONTREAL, Eastern Townships Bank Bldg. TORONTO, 143-149 University Ave. WINNIPEG, 34 Royal Bank Bldg. LONDON, ENG., 88 Fleet St., E.C.

Vol. X Publication Office: Toronto, August 7, 1913 No. 6

For Compactness and Efficiency Use



3 Tons to 12 Tons made as above. Half Ton to 2 Tons are made with Single Load Chain.

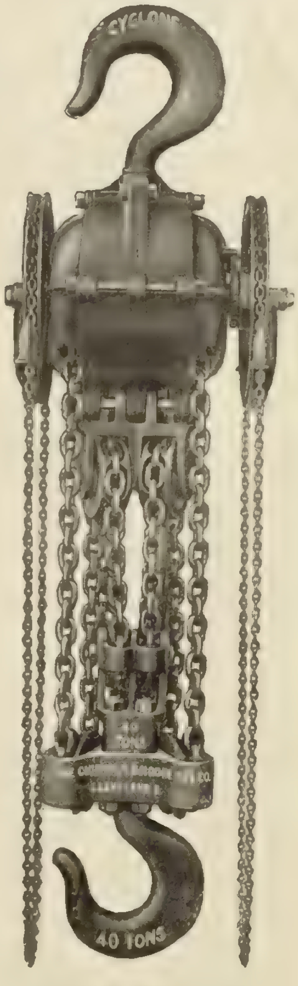
"CYCLONE"

High Speed Chain Hoists

The friction loss in the "CYCLONE" eccentric gyrating gear (patented) is so slight that the average efficiency of the hoists is nearly 80% throughout the whole range of sizes. In consequence of this efficiency, "CYCLONE" Hoists are geared higher than any others without increasing the hand pull.

All "CYCLONE" Bearings have self-lubricating Graphite Bronze Bushings which require no oil, and will run indefinitely without cutting.

Every "CYCLONE" Chain Hoist, and every part of it, carries the makers' guarantee. If any defect develops at any time, write the Canadian Distributors.

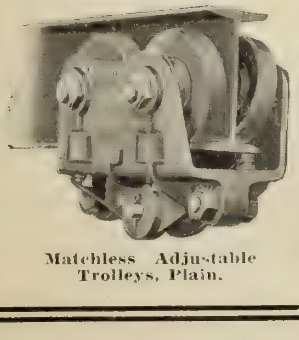


16, 20, 30 and 40 Tons made as above.

Matchless Trolleys

have flangeless track wheels, with vertical guide rollers. This lessens friction, and enables them to run on curves as short as 18-inch radius. Each size adjustable to 3 widths of I Beams.

Write for Illustrated Catalogue describing full line of Hoists and Trolleys.



Matchless Adjustable Trolleys, Plain.

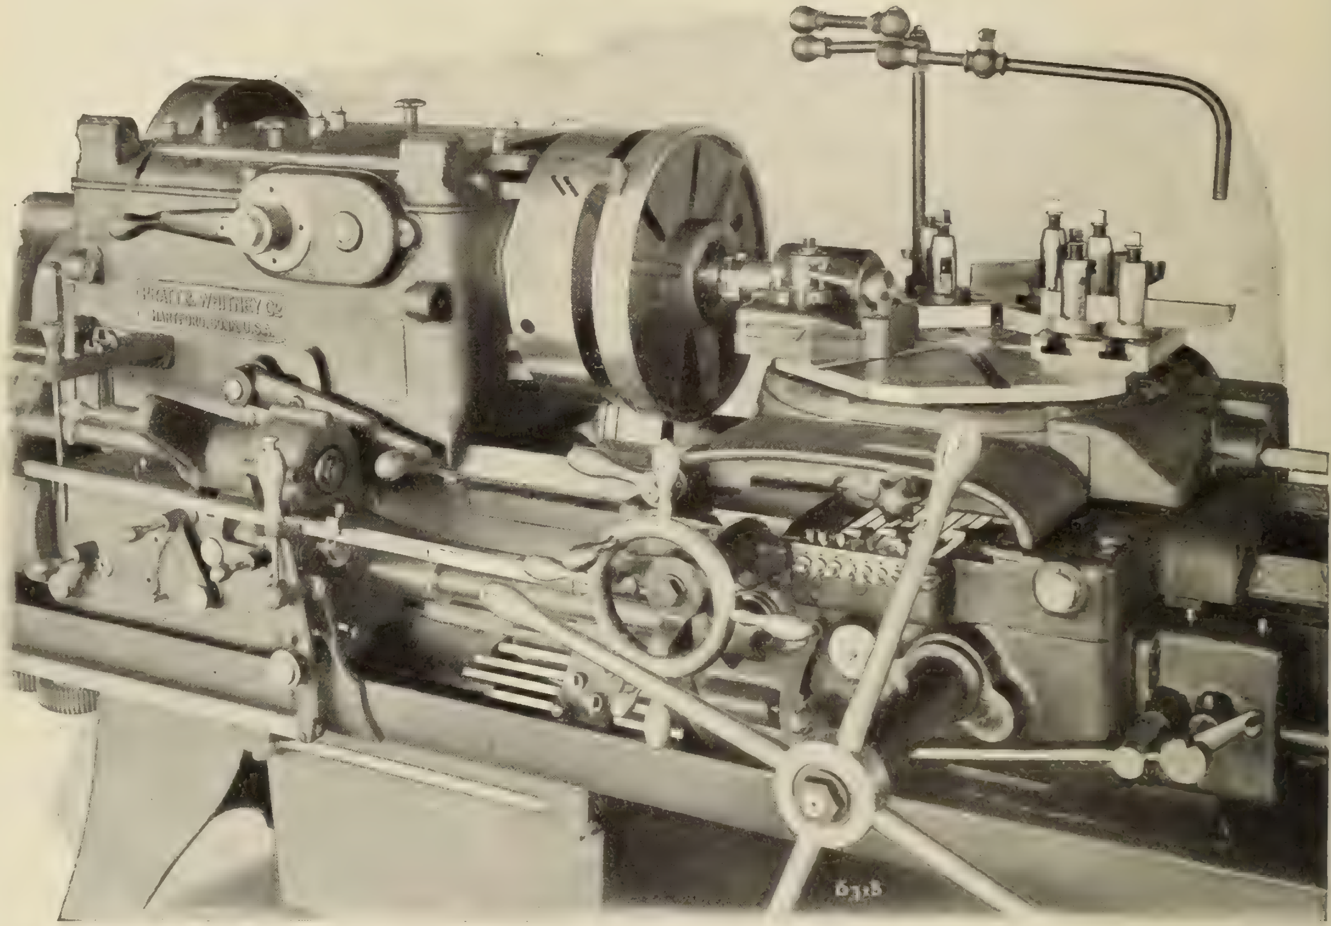
Matchless Adjustable Trolleys, Geared.

Here's a Simple Tool Equipment For Finishing Castings

Including Threading



P. & W. Turntable Lathe

With threading attachment which may be furnished. Work is machined and threaded at one setting assuring absolute concentricity of threads and machined to surfaces.

Operator Has Complete Control While Watching Work.

A glance will show that the operator has complete control of the machine, including speeds, feeds and threading attachment, without taking his eyes from the work. Note how accessible and how easily all the stops are adjusted.

Ample rigidity and power enable the operator to take heavy roughing cuts and accurate finishing cuts. This in conjunction with convenience of operation assures maximum output and a first class finish.

Rigid, Quick Operating Threading Attachment.

The threading attachment furnished for the P. & W. Turntable Lathe combines speed with extreme rigidity, being a part of the machine itself. A separate train of gears is used for threading and the feed and threading mechanisms cannot be engaged at the same time. The tool slide may be clamped rigidly to the turntable directly under the tool. Automatic stops are provided in both directions and the tool is returned at high speed.

Send drawings of your chucking and rod work—we shall be glad to advise you as to output, necessary tool equipment, etc.

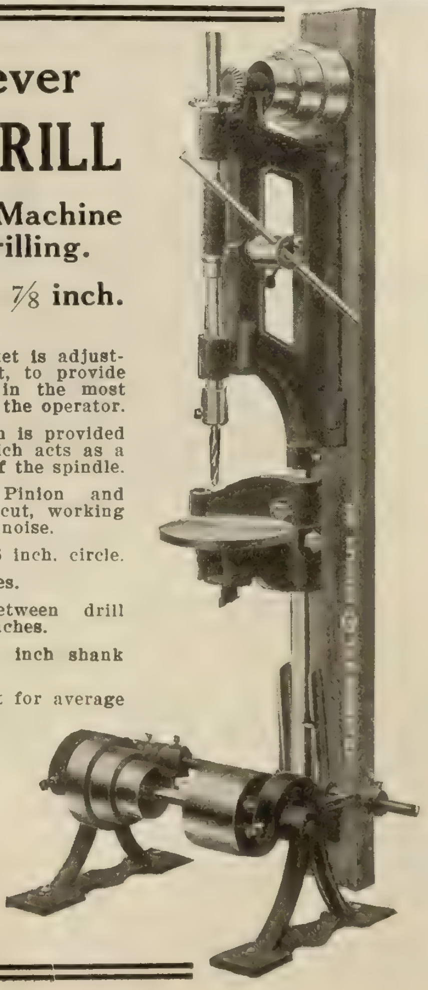
16 in. Lever POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16 inch. circle.

Run of feed $5\frac{1}{4}$ inches.

Greatest distance between drill spindle and table, 23 inches.

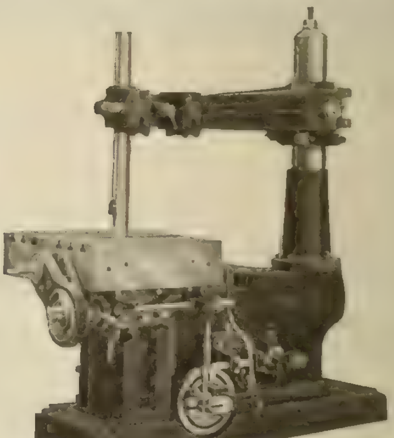
Spindle bored for $\frac{1}{2}$ inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

A. B. Jardine & Co.

Hespeler, Ontario

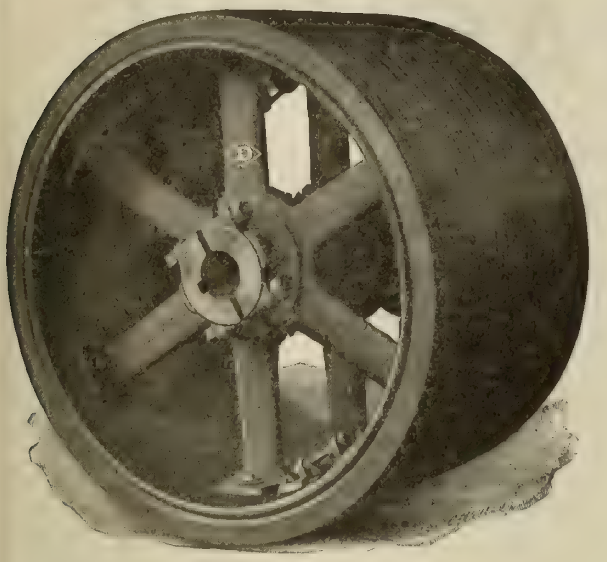
Keyseater and Slotter



Will cut keyseats, internal gears, internal ratchets, oil grooves, miscellaneous slotting, etc., more accurate and quicker than any machine on the market.

Baker Brothers, Toledo, Ohio.

The Pulley Without a Peer



DODGE
IRON CENTRE WOOD RIM PULLEY

¶ The combination of wood and iron is an engineering triumph. The wood rim gives high tractile efficiency, tests showing that it is superior to iron in the proportion of 46 to 22. Lighter belts and less tension can be used thereby minimizing pressure on bearings, all of which decreases friction.

¶ It can be run at a higher speed than any other pulley, — one of these pulleys was tested to a rim speed of five and a half miles per minute without any resultant damage.

¶ Made solid and split in all sizes to twenty feet in diameter, for any strength, for any speed and for any service for which belting can be used. It is a pulley that is quite in keeping with the other members of the famous Dodge Line of Power Transmission Equipment.

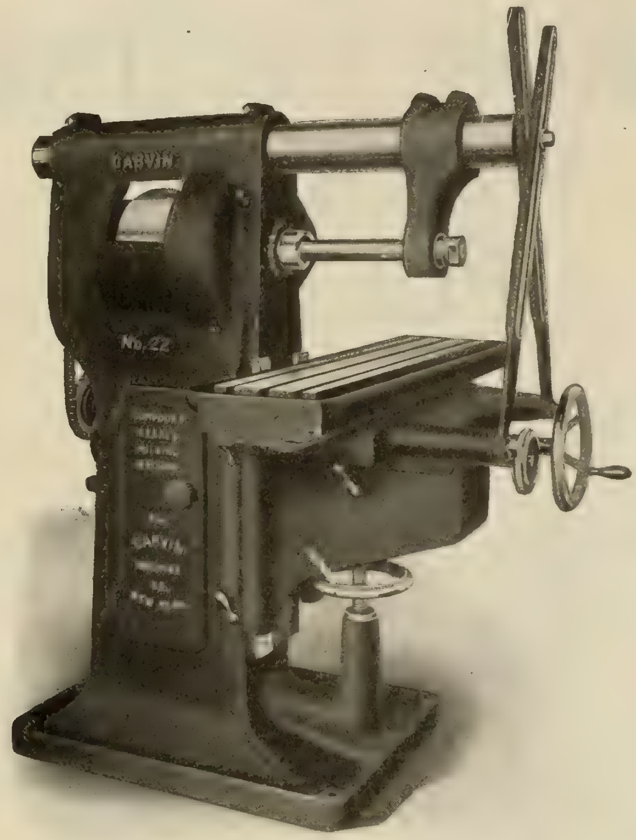
DODGE MANUFACTURING CO., LIMITED

EVERYTHING FOR THE MECHANICAL TRANSMISSION OF POWER

TORONTO **MONTREAL**

MOST POWERFUL MILLING MACHINE

(Knee Type)



GARVIN No. 22, Plain Milling Machine Compound-Geared. Use Code, "Aperient"

The machine shown is the most powerful Knee Type Milling Machine manufactured by us, having Compound Back Gearing whose ratio is 10 to 1, through steel gears. It will transmit 10 horsepower to 14 inch cutters, running 20 revolutions on steel castings. The machine has a wide faced pulley of 11 inches in diameter, running loose on the spindle. The power is taken from the countershaft by a 6-inch double belt to this pulley and double-backed-geared back to the spindle. The machine has an arbor 2 inches in diameter, solid, with spindle, thus avoiding a lot of arbor troubles.

DIMENSIONS

Length of automatic feed of table	28 in.
Dimensions inside of oil pockets	43½x9 in.
Vertical adjustment	15½ in.
In and out adjustment	7 in.
Crated weight	3250 lbs.

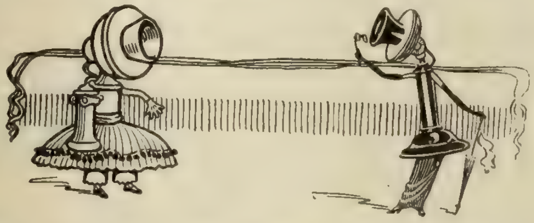
Universal, Plain, Hand, Vertical, Duplex, Profile and Vertical Spindle Milling Machines; Surface, Hole, Cutter and Tool Grinders; Die Slotters; Screw Machines; Monitor Lathes; Automatic Chucks; Screw Machine and Milling Machine Tools and Attachments; Automatic, Horizontal and Vertical Tapping Machines; Duplex Horizontal Drills; Gang Drills; Hand Lathes; Screw Slotting Machines; Spring Coiling Machines; and Special Automobile Machinery, Etc.

Why MILWAUKEE MILLERS Are Built Exactly As They Are.

A Human Story of the Evolution of a Machine

No complete machine ever sprang Minerva-like from the brain of its inventor.

On the contrary, every noteworthy mechanical device of to-day has left in its trail a melancholy row of scrap piles, each marking the grave of an unrealized hope.



The telephone of 1913 would turn up its ebony nose at its crude forefather of 1883. Indeed, it would probably disown its immediate, though unfashionable parent of 1903—especially if telephones are considered to be feminine.

Birth, infancy, adolescence, youth, maturity, senility, death are just as typical of machines as of men.

Machines are born of an idea, often crudely complex and only partly practical. Unforeseen defects and obstacles develop, and various props and jim-cracks are devised to strengthen weak places and correct fundamental faults.

These props and jim-cracks are often exploited as peculiar and exclusive virtues, and are sometimes copied for so many succeeding generations that they become accepted as "standard" in the art.

Read a machine's horoscope in the scrap piles of its past—yes, those scrap piles also spell out the personality of the men who build the machine.

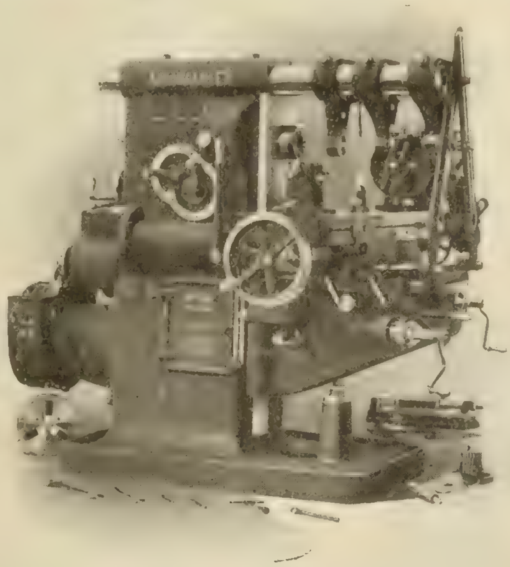
The courage to scrap a good device and all the expensive patterns, dies, jigs, templates and tools that form it just because a better device is discovered—is courage of no mean order.

Unfortunately, too, that courage, when it is displayed, meets discouragement and tardy reward from the very crafts it is designed to benefit, and the apathy of the self-satisfied craftsman toward the new idea is sometimes fanned into open hostility by the specious arguments of the self-satisfied makers of machines that perpetuate the old.

The horoscope of the Milwaukee Milling Machine, as read in its scrap piles, is of engrossing interest.

That its scrap piles are fewer than those behind other machines is due to the fact that the two men who created it started only a few years ago where many others left off—indeed, when many others are content to stick to the present day.

But every grave of every costly design or device that does lie behind these men marks a definite step forward; as we shall show.



And the task which the writer has set for himself is the telling of the human story of an almost human machine—step by step—showing the reason back of every change, every improvement, every departure from so-called "standard" design.

As these chapters unfold themselves they will carry with them lessons to all men who have not yet reached that dangerous stage when they know everything worth knowing.

REDUCE YOUR
"Labor Hour"
COST

A WISE factory superintendent will rearrange his machine shop at reasonable cost to save steps and time. In some shops a $3.50 man will be issued only one 25-cent file per week. Now, a new file, day by day, will increase output easily 15% for that $3.50 man, or the equivalent of $24.15 in efficiency at $22.50 wage and file expense per week. This means over $1,700 extra profit per year on a 20-man shop. Think of it! Here is $1.65 net weekly gain, per man, in efficiency made by recognizing that a minor tool of low cost is the key to getting full value from the payroll expense. "Nicholson-made Files" are swift-cutting hand-tested brands, made from private steels by special tools and methods. Their quality and uniformity make them a standard for efficiency in factory economies. All jobbers.

The "Walking Delegate" of Discontent

¶ The man who fans the flames of discontent in a business firm, in a factory or out on the job, is always a man who holds a position of small consequence—a man whose services and knowledge are never important—whose salary is always small.

¶ A good many years ago, back in the Lumber Camp, we had with us a man whose nose was long and sharp, whose digestion was out of order, who knew something about the "past" of every man in camp and who, incidentally, failed to perform his part of the work. It was the business of this man to create discontent.

¶ The idea of loyalty had never lighted up his mind. The flower of sincerity had never blossomed in his soul. There was no soil that would produce either loyalty or sincerity. He was dissatisfied, discontented and constantly talked about "qutting his job" and going over with the opposition.

¶ He gave away business secrets—and confidence to him was a thing of chaff. No information and no character was sacred in his hands. No reputation was safe. It is in the mind and in the heart of a man of this type that the "STRIKE" has its origin. The flames of discontent are always kindled by a man who shirks his duty, who is at heart an idler and who last of all is mentally sick.

¶ Looking back over the years, back over the positions I have held and over the various kinds of work I have done—everywhere—in the candy shop, in the bedding factory, in the power house and all down the line, some character looms up who fulfills this description.

¶ A man who strikes is simply a part of a great mob—a part of the great many—a man whose individual importance is lost and swallowed up in numbers.

¶ Looking back over the past I also observe that the man who stood by the head of the firm, the man who knew the value of loyalty, the man who never responded to the "call of arms" to oppose the interests of his firm, is the man who is now directing other men, the man who has a home, a bank account and most important of all, the man who has a Future.

¶ Every man who spreads discontent is in reality organizing a strike—he is looking for someone to go into the *Disintegrating Business* with him—someone to help him "ride on the brake and cut down the power." Someone to block the machinery of the firm whose interests he is paid to promote and defend. In other words, he is bent on throwing a monkey wrench into the fly-wheel of the business machine of which he himself is a part and clog and stop and wreck the whole affair.

¶ If we do not rise above a mere job, a mere daily wage, we have nobody to blame but ourselves. Oh, I hear you say "what of the man who worked hard, who believed in himself and went down to despondency and failure," but it is out of failure and out of mistakes that man's strength really comes.

¶ A man who declares his opposition to the firm with which he is connected, whether in violence or in spreading discontent, is hastening the day of his own failure—is writing the epitaph across the tombstone of his own opportunity to be *A Man* who can enjoy the beautiful things of life and add something worth while to the World through having lived.

The Tool Steel Feature From a Salesman's Point of View*

By G. M. Bigger **

The advances made in the quality production of tool steel have contributed almost wholly to bring about the present magnificent high grade machine equipment found in both large and small mechanical engineering plants, and no more interesting profitable and fascinating study than this unique feature can engage the attention of mechanics and those responsible for the output of our workshop.

WITH the highest grade tool steel manufacturer, only three general classifications are usually recognized, under present condition. There are what are known as the water-hardening carbon steels, alloy steels, and high speed steels. The processes and methods of tool steel manufacturers have wholly changed within the past ten or twelve years. In addition to the usual grades and tempers of carbon steels, numerous alloy steels, such as nickel steel, nickel-chrome steel, nickel-vanadium steel, chrome steel, chrome-vanadium steel, vanadium steels, tungsten and tungsten-vanadium steels, are made to meet countless conditions and requirements.

Water-Hardening Carbon Steels.

Let us first refer in our discussion to what are generally known as the water-hardening carbon steels. In 1908, a Board on Tool Steel, appointed by the U.S. Navy Department to investigate the quality, shape, size and brands of tool steels to be used in the Navy Department, reported these requirements:

"That first in importance of the desirable qualities tool steel should have, is that it shall be of uniform quality throughout for each and every grade.

"That it shall be of such chemical composition that it is not likely to fire crack in hardening, under proper conditions.

"That this chemical composition should be such as to render it as little liable as possible to be ruined through carelessness in forging the tools, or in subsequent grinding, and that the tools shall be as strong as practicable in the body.

"That the composition permit of forging it through a comparatively wide range of temperatures; and finally, the steel should be free from seams, cracks and other surface imperfections."

When one reads these requirements he is impressed with the precautions that the manufacturer must take to make his steel "fool proof."

It will be found by examining the catalogues and products of nearly all the American manufacturers of crucible tool steels that the carbon steels generally group themselves into three classes:—First a grade that sells at about 7 cents per pound base; second, a grade that sells at about 12 cents per pound base, and, third, a grade that sells at about 18 cents per pound base. Each of these grades is made to meet a certain class of trade, and it will be found that all the manufacturers are well equipped to yield a product of high standard in each class. As we all know, each of these grades are made in various tempers; that is, they contain varying percentages of carbon to suit the different conditions of service, and the heat of forging, annealing or hardening, and the temperature to which the temper is drawn after hardening is regulated by the amount of carbon they contain. In general, steels containing a lower percentage of carbon require a higher heat in each operation than those containing higher percentages of this element.

Temper and Quality Features.

It may be well to state here that quality and temper of steels are two very different things. The temper of steel does not constitute its quality. The different grades and qualities of steel are made in the same temper, and the price is regulated by the quality. Quality in this sense is determined by the grades of material used in the manufacture of the steel, while temper means the carbon contained in the steel. I wish to call attention to the fact that the word temper in this sense must not be confused with the same word used in relation to drawing a hardened piece of steel. In drawing, we say, draw to a light straw temper, a dark straw temper, a dark blue temper ,a light blue temper, a black temper as the case may be. In these connections, the word temper has no relation whatever to the carbon contained in the steel. A great many times I have heard men say they wanted " a high carbon steel," when in reality they wanted only a high grade of carbon steel. You can get the same amount of carbon in each of the grades mentioned.

Carbon Steel Tempers.

In carbon steels the manufacturer usually runs his tempers in six classes:—First, steels containing from 0.70 to 0.80 per cent. carbon; second, steels containing from 0.81 to 0.91 per cent. carbon; third, steels containing from 0.91 to 1.00 per cent. carbon; fourth, steels containing from 1.01 to 1.10 per cent. carbon; fifth, steels containing from 1.11 to 1.20 per cent. carbon, and sixth, steels containing from 1.21 to 1.30 per cent. carbon. These various tempers are used in the different grades for about the following purposes:

In the 7 cent grades, steels containing from 0.70 to 0.80 per cent. carbon are used for such work as anvil facings, pinch bars, blacksmith's tools, drift pins, etc.; steels containing from 0.81 to 0.90 per cent. carbon, for peen hammers, skate blades, cold chisels, etc.; those containing from 0.91 to 1.00 carbon, for chuck jaws, spring, hatchets, etc.; those containing from 1.01 to 1.10 per cent. carbon, for lathe centres, auger bits, axe bits, etc.; those containing from 1.11 to 1.20 per cent. carbon, for files, cold cutters, stone cutting bits, and similar purposes, and those containing from 1.21 to 1.30 per cent. carbon, for dies for heading machines or similar purposes.. The best grades in the different tempers are used for such purposes as button sets, band saws, drop forging dies, cutlery, large and small taps, threading dies, milling cutters, twist drills, chasers, gravers and many other purposes.

Hardening and Tempering Feature.

Considerable progress has been made in the hardening and tempering of carbon steels within the last few years; but a visit to the hardening rooms of many plants that are supposed to be up-to-date in all particulars reveals the fact that adequate equipment for hardening and a knowledge of the critical points of steel, with the changes that take place when it is heated, as well as others that occur in drawing the temper, are in many cases lacking. The results of not heating or drawing the temper accurately, and the irregularities of antiquated methods of forging or treating have in a great many cases wrought disaster to a piece of good steel, and the entire blame has been placed on the manufacturer.

It is impossible in the scope of this paper to give accurate forging or hardening tempers for each grade or temper of steel, or even to state the exact degree to which they should be drawn. In general, when forging, however, it is good policy to heat slowly and uniformly at first, before raising the temperature to the exact forging point, to insure an even distribution of heat throughout the piece. When heating in a blacksmith's forge, the fire should be kept clean and of ample volume to surround the piece completely. Always use extreme care so that the air blast does not strike the steel when heating; also see that there is a good bed of clean fire between the tuyere and the steel. Dirty fires are cause of many failures and in many cases of local overheating or burning.

---

*From a Paper read before the Metal Trades' Foremen's Club, Dayton, Ohio.

**Cincinnati Manager, The Vanadium Steels Alloy Co., Latrope, Pa.

When heating for hardening, ample time should be taken to heat the steel slowly to the hardening point. Extreme care should be taken to protect it from the action of a direct furnace flame, and also from any other causes that may interfere with successful hardening. The greater the care, the better the results. Always be sure of a perfect distribution of heat. Avoid overheating thin parts or edges.

Hardening Expensive Tools.

A good suggestion to follow in hardening tools when the operator does not know the amount of carbon contained in the steel is to cut a small piece from the end of the original bar, and harden it at different temperatures. A hardness test with a file, and the appearance of a fracture will enable you to determine the least possible hardening heat that will be necessary to give the steel to insure the proper hardness. This plan should be followed especially when making up expensive tools. as the results obtained will more than compensate for the amount of labor expended.

Best results in hardening are obtained when the heating is done in a muffle furnace, either oil or gas fired, as in these furnaces the steel does not come in direct contact with the flame. The successful hardening of delicate tools depends largely on the condition of the atmosphere to which the steel is subject; whether it is oxidizing, reducing or neutral in character. Carbon steel, it is generally conceded, can be hardened most favorably in an atmosphere where the oxygen in the air is entirely consumed. In an atmosphere of this nature, the scaling or oxidation is reduced to a minimum. It is because of these general conditions that the electrically heated furnace is now spoken of so highly for hardening purposes.

It is very evident that, to get the best results from tool steels, they must be hardened and tempered properly. To do this, certain apparatus is necessary, such as proper heating furnaces, adequate cooling baths, the proper tools and tongs, and, last but by no means least, a good pyrometer. Whether the operation is forging, hardening or tempering, there is for each grade and temper of steel, and the particular use thereof, a well defined temperature point that alone gives the best results in work. A marked variation from this temperature may do irreparable damage. The use of a suitable pyrometer is recommended for all hardening purposes, and a pyrometer or thermometer for obtaining the temperatures of all drawing baths. When using a pyrometer, reasonable care must be exercised to see that the readings are truthful and reliable. Pyrometers may frequently go wrong, and unless the operator is an experienced hardener, the results may be disastrous.

The Hardening Medium.

In most cases, water is used as a hardening medium for carbon steels. Where extreme hardness is desired, a solution of salt water, brine or ice water can be successfully used. In other cases, articles to be hardened are quenched in a bath of water, and before they are cold, or have ceased contracting, they are removed from the water and placed in oil. This is true of such articles as milling cutters, some forms of punching dies, taps, reamers, etc. Some steels require to be quenched in oils only. Lard, fish or whale oil is preferable for this purpose, but any recognized light tempering oil will do. However, heavy fatty or mineral oils should be avoided. In all cases, the cooling baths should be of ample size, and a temperature as nearly uniform as possible should be maintained.

All tempering of carbon steel should be done in an oil heated bath or other medium by which the drawing temper can be kept uniform. For taps, dies, reamers, milling cutters, etc., relieving the strain is all that is required. In other tools, where toughness is the predominating factor the temper may be drawn slightly more.

Decarbonization.

When we say a piece of steel is decarbonized, we mean that the surface, for a few thousandths of an inch deep, has lost some of its original carbon during the process of annealing. All annealed steel is more or less decarbonized, and when intended for tools of any description that are to be subsequently hardened, sizes large enough to permit the removal of at least 1-32 in. on a side should be ordered. Failure to remove the outer surface of annealed steel of all grades or tempers will consequently give trouble in hardening.

The Alloy Steel Feature.

The term alloy steel is used to distinguish steels containing nickel, chromium, vanadium, titanium, or other elements in varying percentages, from the carbon steel in which the characteristic properties are dependent upon the presence of carbon alone. Up to the last two or three years, nickel steel was, perhaps, the most used of all the alloy steels. It is usually made in the open-hearth furnace, and contains from 0.20 to 0.50 per cent. carbon, and about 3.50 per cent. nickel. Lower carbons than these are sometimes used for case-hardening purposes. This steel has many excellent mechanical qualities, and is generally conceded to be a good free cutting material.

Chrome Steel.

Referring to chrome steel, I am personally familiar with a variety of this steel containing from 0.80 to 1.20 carbon, and from 3 to 3.50 per cent.. chromium. This steel is used specially for hot work with excellent results, as for gripper dies, bolt header dies, riveting dies, and what are known in fabricating or boiler shops as bull dies. It can be easily annealed under exactly the same conditions as carbon steel, excepting that the annealing temperature is slightly higher; in this state it is very free cutting. When properly hardened, and used for the purposes stated above, the users expect to get from six to ten times as much work from this steel as from ordinary die steels. Actual records show where riveting dies have driven over a quarter million ⅝ x 2 in. rivets without redressing.

Chrome-Vanadium Steels.

Chrome-vanadium steels of numerous types are now manufactured. The service and test records of this class of steel show remarkable results, and its use will be greatly increased in the near future. Vanadium in steel is supposed to impart anti-fatigue properties. Under proper heat treatment, this steel has been made to assume higher physical properties (expressed by the elastic limit, tensile strength, torsional test, impact test and bending test), than any other type of steel. It is largely used in automobile construction for driving axles, for gears, pinions, pins, pressed or stamped parts, valve steam, etc., in fact, it gives excellent service in any parts calling for strength or durability. It is especially recommended for all spring requirements and it is guaranteed to have three times the life of carbon steel spring.

Test Data.

Tests were made recently by an associate salesman of my firm to determine the relationship between carbon spring steel and chrome-vanadium steel for motor-cycle springs. The greatest durability was the prime requisite of these springs, and the test was of vital importance. A very ingenious device was constructed so that the end of each spring was made to oscillate under force from a shaper at the rate of 4980 vibrations per hour. It was found under proper heat treatment that carbon steel stood this test for an average of 36 minutes only, while chrome-vanadium steel averaged 5 hours and 40 minutes. The chrome-vanadium steels require a special heat treatment. The springs referred to were heated to 1350 deg. Fahr. and quenched in oil; the temper was then drawn to 700 to 900 deg. Fahr.

Chrome-vanadium steel for gears is proving the superiority of this class of steels. For this purpose, it is made in case-hardening and oil-hardening tempers. The oil-hardening type contains about 0.45 to 0.60 per cent. carbon, so that by merely heating to the proper temperature and quenching in oil, the gears are made sufficiently surface hard to withstand all ordinary wearing conditions, while the core is tough and strong.

The High Speed Steel Feature.

Since 1901, high speed steel has had a rapid growth, and extensive sales. Only those who have kept in close touch with its manufacture and uses can appreciate the tremendous amount of work in the way of efficiency tests that has been necessary to bring it to its present state of perfection. With the introduction of vanadium into this grade of steel about 1908, a very important step was taken. Now, all good grades of high speed steel contain more or less of this element.

Vanadium Addition and Grinding.

In regard to this, numerous tests have proven that a steel that will cut at 10 per cent. faster speed, will last twice as long between grinding (if the speed is not changed), and a steel that will stand a 20 per cent. faster speed will run four times as long between grindings. A steel that will stand 30 per cent. faster speed before it reaches the breaking-down point will last eight times as long without sharpening, if the same speed is used.

Each addition of 0.3 per cent. of vanadium adds 10 per cent. to the possible cutting speed, and doubles the life of a tool at the same speed and feed. It has been shown that 0.3 per cent. vanadium allows 10 per cent. increased speed, or 10 per cent. more metal removed in same time; that 0.6 per cent. vanadium allows 20 per cent. increased speed or 20 per cent. more metal removed in the same time; that 0.9 per cent. vanadium allows 30 per cent. increased speed or 30 per cent. more metal removed in the same time.

Stating the effect in terms of increased times between grindings, it has been shown that 0.3 per cent. vanadium doubles the time between regrindings, that 0.6 per cent. vanadium quadruples the time between regrindings, and that 0.9 per cent. vanadium gives eight times as much metal cut between grinding at the same speed and feed.

High Speed Steel Tools.

I contend that high speed steels containing vanadium will run much longer between sharpening, in proportion to the quantity of vanadium they contain, up to 1¼ per cent. High speed steel is used for such purposes as lathe and planer tools; it is invaluable for swan-neck tools; special dies, which have heretofore required very great care in hardening; punches, boring tools, cutters, straight drills, twist drills, special taps, hard wood knives and all kinds of milling cutters, and it is especially valuable for involute or gear cutters in which accuracy of form and long life are necessary. These steels are usually furnished annealed by the manufacturer, and it is the best policy to permit the manufacturer to do all the annealing for the user. However, should it be found necessary to anneal a piece of this steel, the following is a good method of procedure:

Annealing Procedure.

"For all annealing purposes, use an iron box or pipe of sufficient size to allow at least one-half inch of packing between the steel to be annealed and the sides of the box or pipe. Pack carefully with powdered charcoal or lime. Cover with a cap which should be air tight. Heat slowly to a full red heat; say, about 1,500 or 1,550 deg. Fahr., and hold at this heat from two to eight hours, depending on the size of the piece being annealed. Cool as slowly as possible, and do not expose the steel to the air until it is cold."

The Furnace Feature.

Electrically or gas fired furnaces designed for high heats are now made to do very satisfactory work in hardening this class of steel. Tools to be hardened should be heated to a white heat just below the blistering point. The heat should be the highest possible in view of the importance of preserving the cutting edge. The higher the heat, the better the results. Proper care should be taken to heat slowly and uniformly to the proper hardening temperature, also to avoid overheating thin parts or sharp edges.

Tools of this class of steel can be either quenched in oil or other semi-active medium, or in some cases the whole tool can be cooled in the air blast. In all cases, the temper should be drawn to relieve the strain, or to the proper degree to get the best results.

Drill Jig and Fixture Design and Construction

By H, R.

The sketches and data will, the writer hopes, appeal to machine shop superintendents, designers, toolmakers, and novices, as indicating the large place jigs of every kind and for every service occupy to-day in machine shop practice. The present article is the first of a series.

IN jig and fixture design, the field for ideas is immense. By a new method of clamping the work in the jig, it may mean the saving of hundreds of dollars or even more in workmen's time alone. There are many useful ideas lost, simply because the toolmaker or designer has thought of new methods whether adapted to the particular work on which he was engaged or not and neglected to make a sketch of the device.

The Drill Plate Jig.

The drilling jig is one of the earliest developments in the line of appliances for making repetition parts. In the simplest form, it is merely a plate attached to the work, having holes corresponding in diameter and location to the holes to be drilled. The entire jig plate may be hardened, or as is more usual, the locating holes are in hardened steel bushings inserted into the body of the jig. With such a jig properly located, the laying out of each piece is avoided; the only error the operator can commit being to drill too small a hole or to omit one or more of them altogether.

Miscellaneous Jigs.

From the elementary plate jig there has developed a large class of remarkably useful metal manufacturing appliances. Other types of jigs are box jigs, which are used where holes are drilled in all or nearly all of the sides of a piece. In case of very large components, the sides are cut away where the metal can best be spared so as to make them easy to handle. It is necessary to have jigs extremely rigid so that they will not be distorted when the work is clamped in position, or under the pressure of the drill. On the other hand, as before mentioned, they should be as light as possible so that they may be readily handled by the operator. Of course, it is constant practice and experiment that leads to the successful production of jigs. They are often made so as to be suitable both for bronze and cast iron, off the same pattern. Good judgment should, however, be used in all cases. Another type of jig is the built-

DETAILS OF JIG AND FIXTURE DESIGN AND CONSTRUCTION.

up pattern, made from cast iron stock plates. These are cut and carved, and then afterwards screwed and dowelled together.

Some manufacturers argue that these are cheaper to make. When a rush job is required it is generally so, but I think a far better jig is obtained from a properly designed casting and at less cost. Other manufacturers, again, have adopted aluminium as a suitable metal out of which to produce their jigs. This is very good for work up to a few pounds in weight, but for weights above this, I think no metal can offer better results than a good iron casting. Besides, aluminium is an expensive metal out of which to produce jigs. One most important consideration in jig design is the selection of suitable locating points for the same piece in the fixtures of milling machines, etc. If this element is not properly considered, the relations between the drilled holes and other machine cuts may not be accurate, owing to variations in castings, forgings, or other pieces as are sure to exist.

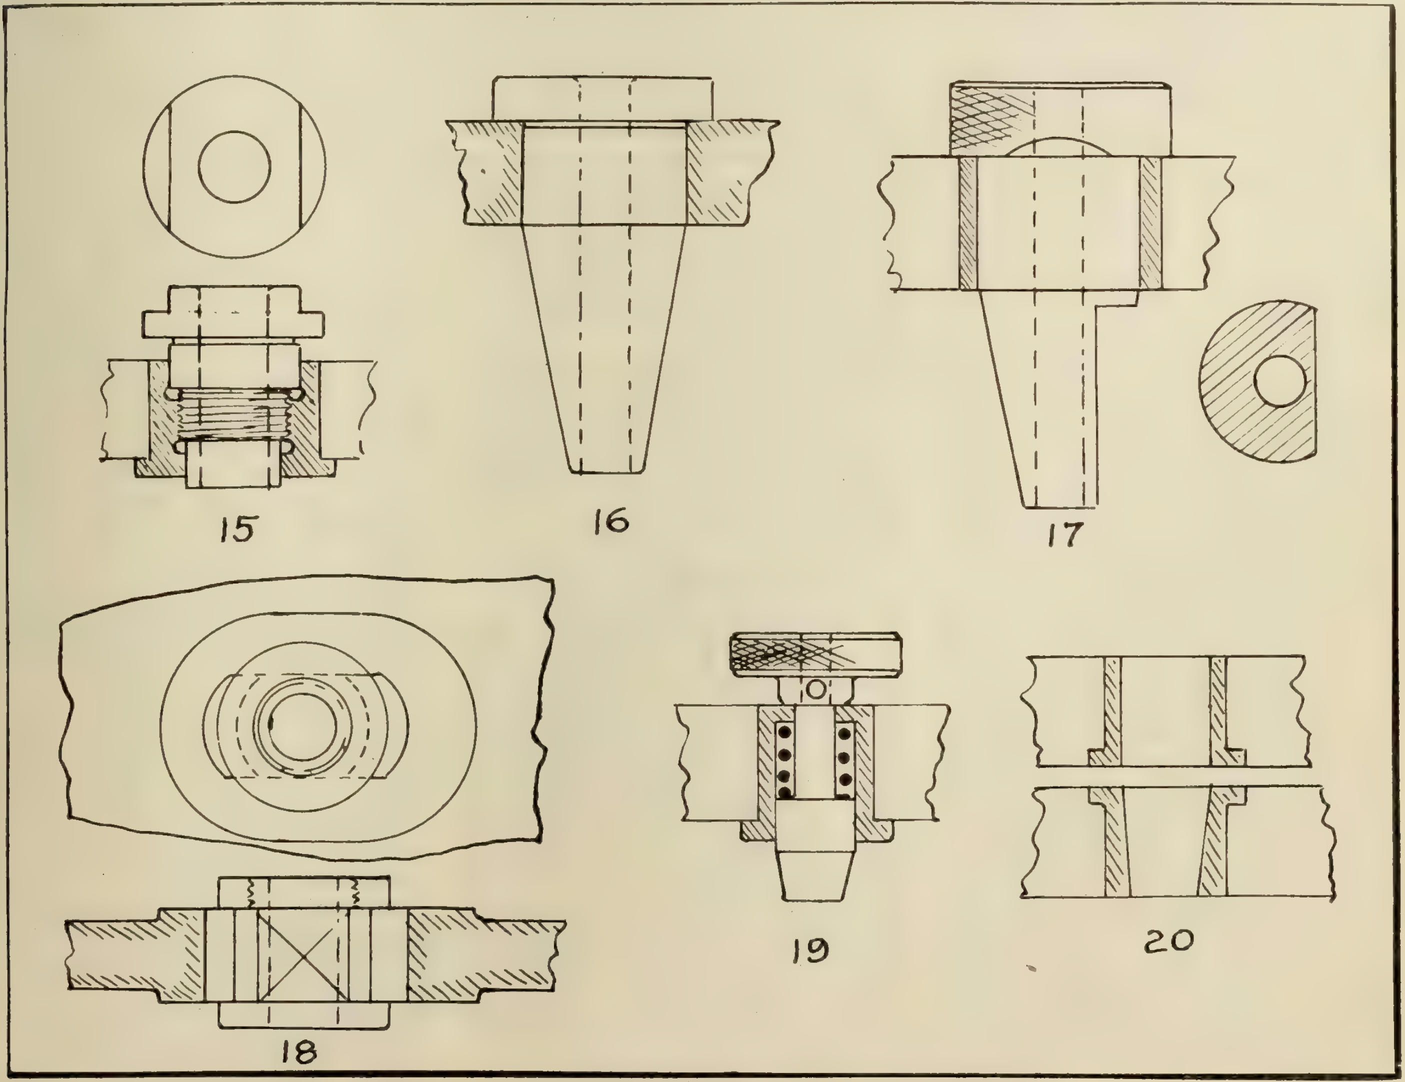
To explain the sketches herewith, Fig. 1 depicts the most common of all drill bushings. These are called fixed or stationary bushings. They are also used as linings for slip bushes. Fig. 2 is of the same type as Fig. 1, but with a stop collar formed. This is to prevent the bushing being pressed through the jig. These are more adapted for multiple spindle work.

When drilling and reaming operations are to be performed in the same jig, two slip bushings should be used, one for the drill and one for the reamer, and when the jig is to be used for a large number of parts, the hole for the slip bushing should in turn be bushed with a steel lining, Figs. 1 and 2, to prevent wear. The soft cast iron will wear rapidly if this is not done, and the jig will soon have to be rebored and rebushed. I have shown several types of slip bushes. Fig. 3 is the most popular. Fig. 4 is the same as Fig. 3, but is provided with a means of removing the bush if same becomes taut, owing to the swarf getting between the slip bushing and the liner.

Drilling Small Holes.

The drilling of small holes requires great speed or at least they can be run at many revolutions per minute. This means that some arrangement has to be made to keep the slip bushings from revolving with the drill. When this happens, the hole being drilled very often runs out of truth, owing to the drill having revolved the bush from its bearing long before the hole has been finished. To prevent this contingency, the drill slip bushings shown by Figs. 5, 6 and 7 appear to be those in general use, having proved successful through their easy manipulation and cheap production. Fig. 5 arrangement not only keeps the bushing from turning, but is held down by the screw (A). It will be as well to note the method adopted in fitting this into the jig.

If the jig is being used by a piecework man, it is bound to get very roughly handled, and in many cases these holding down screws get damaged so that they cannot be used often. The method shown has proved a way out of the difficulty. Fig. 6 simply keeps the bush from revolving, and Fig. 7 holds the bush down just the same as Fig. 5, but, of course, is cheaper to make. Very often designers are obliged to put holes



DETAILS OF JIG AND FIXTURE DESIGN AND CONSTRUCTION.

close together. Fig. 8 shows a very suitable way of doing this, while Fig. 9 is another way of getting over this difficulty.

Multiple Drilling.

In the past few years there has sprung up a great demand for multiple drilling. This has become popular in the manufacture of automobiles, for the drilling of crank cases, speed cases and other pieces which have a fair number of holes that are convenient to drill at one operation. In designing jigs for this class of work, special care should be taken so as to get all the drills well lubricated. A trough, such as is shown in Fig. 10, should be cast around the jig. This method insures all the drills running in lubricant and each one getting its equal share. If possible, the component should be set on hardened plugs, as the one great trouble in multiple drilling is to get the swarf clear away from the drills. The piece to be drilled should be set away from the bushes at least a quarter of an inch, for if the swarf clogs the drill, it is almost sure to break. A properly designed jig is also the chief feature of this class of work, although much depends on the feed and speed of the machine. Care must also be taken that the drills retain their sharpness. It is very convenient in multiple work to have a number of drills, and an equal number of reamers; this enables pieces to be drilled and reamed without changing for the latter operation.

Some jigs drill from all sides; in this way drilling from the sides and underneath, the swarf has a better chance of getting clear, than from vertical top drilling; but this method is only adopted when there are very large quantities to be machined or operated upon.

In making of jigs for small pieces, it will be sometimes found useful to clamp these by the bush. Figs. 11 and 15 illustrate the best methods for these particular bushes. It will be readily seen that the screwed portion is in the centre of the two plain pieces, and well out of the way of all swarf. It is impossible for the bush to get out of truth. It will also be noticed that this is designed for a slip bushing. The bush, Fig. 11a, shows a suitable method of fixing the bushings in conjunction with the screwed bush. This allows the drill to be put through the piece, being then reamed through another slip bushing, piloted by the bottom bush 11a.

A section is shown in Fig. 12 of a conical bush bottom. This is an excellent method of locating by the boss. Fig. 13 is another method of making these screwed bushes, being screwed down by means of a tommy bar. Fig. 14 shows another screw down arrangement by projections on the top of the bush. Neither Figs. 13 or 14 are as good as Figs. 11 or 15, because the straight portion is in the wrong place, and the screwed part in Fig. 14 is liable to get clogged up with swarf, making it hard to screw down on to the work.

Slip bushings should be made with only three or four threads for screwing down, and as much parallel portion as possible. It will be as well to note the method adopted of putting in the liner. The flange of this is always at the bottom. Great care should always be taken in fitting up of the jigs, and to see that plenty of clearance is given to the bushes, etc., so as to get them easily in place. This may mean the saving of scrapped jigs.

Sometimes it is necessary to drill a hole in a boss or place that it is impossible to get to except by a long bushing. Figs. 16 and 17 show two ways of doing this. Do not carry the bushing any nearer than three-eighths of an inch to the work. This will give the swarf a chance to get clear. Fig. 16 is a fixed bushing and Fig. 17 is a slip bushing.

Fig. 18 shows what is termed a floating bush. In some work there are bosses which should have holes through their centre. Now, owing to the variation in castings, the bosses do not always come as they should do. It may not be necessary to have the hole very accurate in relation to the other holes in the jig, but it would not make a good-looking job if this particular hole is out of line with the centre of the boss. A floating bush is here adopted.

Fig. 19 is the type of bush generally used for spring locating plugs, and Fig. 20, the method of fitting bushes that have to locate two plates together by a plug.

Bushings can be blanked out in quantities and finished to required sizes as needed. Small bushes up to half inch drill should be made of cast steel, and larger sizes in tool steel. Allowances should be made in the blanks for grinding and lapping after hardening.

HYDRO-ELECTRIC POWER MACHINERY CONTRACT.

THE unique position occupied by the Canadian General Electric Co. in the design and construction of Hydro-Electric power machinery is well shown in the contract recently awarded by the West Kootenay Power and Light Co. of Rossland, B. C., In order to increase the capacity of its plant, the latter company decided upon the addition of a 7,500 K. V. A. water wheel driven generator.

The Canadian General Electric Co. will build the generator, while the contract for the water wheel was placed with its subsidiary, the Canadian Allis-Chalmers, Ltd. This water wheel will have a capacity of 9,000 h. p. at 180 r. p. m., under a head of 70 feet. The contract, therefore, will be carried out practically by one firm, who are thoroughly familiar with the design and construction of both electric and hydraulic portions, and with the conditions necessary for their successful operation as one unit.

It is understood that the increase in the generating capacity of the West Kootenay Power and Light Co. has been undertaken in anticipation of the electrical requirements of the Canadian Pacific Railway which intends to electrify the line between Rossland and Castlegar. The contract for the electrification of this section of the railway was also awarded a short time ago to the Canadian General Electric Co.

MANUFACTURERS FROM THE UNITED STATES.

ALTHOUGH certain financial interests in the United States have been leaving only the very smallest stones unturned in their efforts to persuade those of their fellow-citizens who were thinking of emigrating to Canada that blue ruin and financial chaos were just one jump behind the Dominion, United States capitalists do not seem to have been seriously impressed by the arguments presented.

In the Provinces of Quebec and Ontario, there are 195 business corporations, whose head offices are in the United States, but which have been organized to manufacture goods in Canada for the Canadian and export trade. More than half of these companies have been organized in the last ten years. As far as Montreal is concerned, rather more than a third of them have come there in the last five years. Their total capitalization is $230,000,000, which does not look as though the American investor who is looking for safe as well as remunerative opportunities to place his money was very much afraid of what the commercial future of the Dominion had in store.

When the amount devoted to manufacturing is added to the total which the farmer who moves across the border to an Alberta or Saskatchewan wheat ranch brings every year to the country, the expression of confidence in the stability of Canadian investments is as conclusive as it is comprehensive. The immigration authorities estimate that between $100,000,000 and $150,000,000 in cash is brought into the country every year by the farmers who emigrate from the United States.

The Theory and Practice of Screw Cutting on the Lathe

By J. Davies

The author of this series of articles intimates his intention of making the information sufficiently simple and clear, that apprentices and others with only the four rules of arithmetic at their command will be able to intelligently grasp the data and apply it in practice.

REQUIRED to cut .654 with a lead screw, 3 threads to the inch. Find ratio as per rule.

$$\frac{.654}{1000} \times \frac{3}{1} = \frac{1962}{1000} \text{ Ratio.}$$

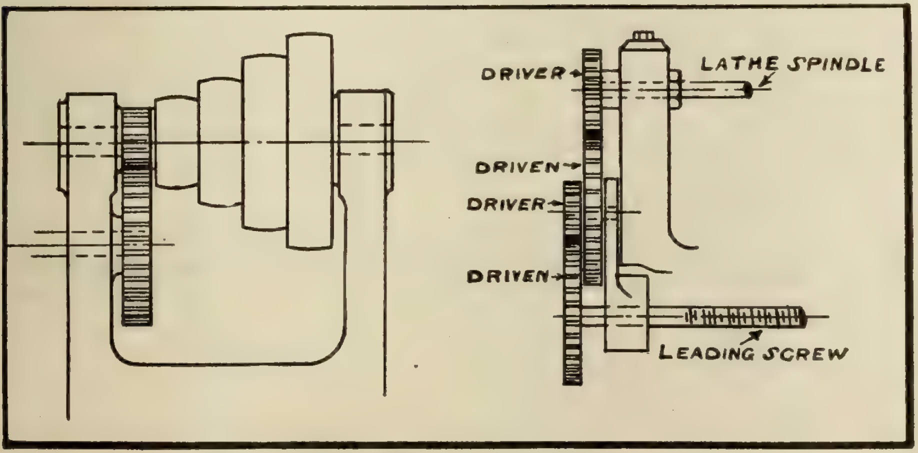
Take the numerator, and divide it by the least prime number, in the table given in our last issue, as many times as you can; then by the next prime number in the table, and so on until you have exhausted the possibilities of further division. You will have then got all the factors contained in that number.

2|1962 Factors 2×3×3×109 = 1962.
3| 981
3| 327
109

Treating the denominator in the same way, we get

2|1000 Factors 2×2×2×5×5×5
2| 500
2| 250
5| 125
5| 25
5

In this example, one of the factors is 109, and by reference to the table of prime numbers, we see that 109 is a prime number, and cannot, therefore, be further divided. It would be impossible, therefore, to cut the above pitch without a gear containing 109 teeth or a multiple of 109.



LATHE DRIVE ARRANGEMENTS.

Having obtained all the factors, arrange them into an equal number of groups for the driving and driven wheels, using as many wheels as may be convenient.

$$\frac{1962}{1000} = \frac{2\times3\times3\times109}{2\times2\times2\times5\times5\times5}$$

$$\frac{40\times25}{18\times109} = \frac{40\times100}{72\times109} \text{ the wheels required.}$$

Find wheels to cut .7854 screw ½ pitch.

$$\frac{7854}{10{,}000} \times \frac{2}{1} = \frac{15708}{10{,}000}$$

2|15708 2|10000
2| 7854 2| 5000
3| 3927 2| 2500
7| 1309 2| 1250
11| 187 5 625
17 5| 125
5| 25
5

N.B.—This pitch was taken from a blue print given to a lathe hand in a Toronto machine shop.

$$\frac{2\times2\times3\times7\times11\times17}{2\times2\times2\times2\times5\times5\times5\times5} = \frac{51\times77}{100\times25}$$

wheels required.

To prove the wheels, multiply all driving wheels together; then multiply all driven wheels together. The ratio should be the same as exists between leading screw and screw to be cut.

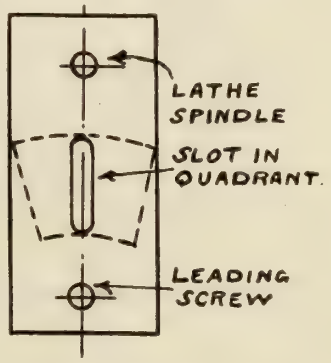
$$\frac{51\times77}{100\times25} = \frac{3927}{2500}$$

Ratio of screw to be cut and leading screw $= \frac{7854}{5000}$

By finding a common denominator, it can be seen at once that the ratios are the same.

Cutting Very Rough Threads.

In cutting very rough threads, avoid as far as possible having a very small gear on the end of the leading screw, as it puts an excessive strain on the wheel teeth, and is a very fruitful source of broken teeth. Do not cut a very rough thread with a single train of wheels; for this reason it is much better to work out a compound set of gears enabling you to put a larger wheel on the leading screw, and thus reduce the pressure on the teeth.



SCALE OR TEST BOARD.

Another fruitful source of breakdown is putting the wheels too deep in gear. The apprentice usually has an idea that the wheels must be geared up to prevent backlash; this is a great mistake. Always allow a little clearance at the bottom of the teeth, and before starting the lathe pull it round by hand until every wheel in the train has made at least one revolution.

Scale or Test Board.

It is very annoying, after having worked out one or two sets of gears, to find out that it is impossible to gear them up after sweating and swearing and getting them all in place but one. To avoid trouble in this way, I would advise the apprentice to make for himself a scale or test board in the following way, and keep it for reference:

(1)—Find out how many teeth there are in one of the lathe gears per inch of the diameter, measured on the pitch line. This is known as the diametral pitch.

Suppose we take the wheel with 100 teeth, and find that its pitch diameter

is 10 in. Then, a circle drawn to represent that wheel would be 5 in. radius. In the same proportion, 10 teeth would be = ½ radius. Now if we draw this to a scale of ¼, then every 10 teeth will be represented by a circle ⅛ radius. If the gears are 8 pitch, then 8 teeth will = 1 in. diameter, or ½ radius, and 10 teeth will = $\frac{1}{2}\times10\times8$ = ⅝ radius.
—
8
Reduced to a scale of 1-5, every 10 teeth = ⅛ radius. Now measure the distance from the centre of lathe spindle to the centre of the leading screw, and draw it out upon a piece of board to the same scale as we used for the gears, which, for 10 pitch, will equal ¼ scale, and for 8 pitch, 1-5 scale. Sketch out the quadrant to the same scale.

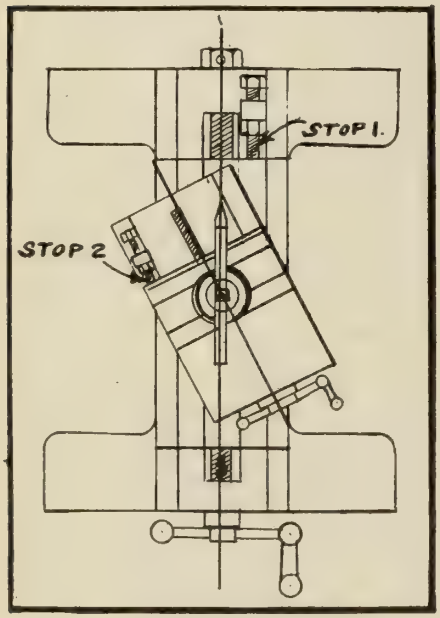


FIG 1.—CUTTING V. THREADS.

To test the gears, take a rule and a pair of compasses and set them to equal ⅛ for every 10 teeth, and mark them out upon the board. It will be seen at once whether the wheels can be geared or not. This test board can easily be made in half an hour. For future use, clean the surface with a piece of chalk, and to avoid confusion, put driving wheels in dotted lines and driven wheels in full lines.

It should be noted here that, in cutting a very rough thread, 6 inches or more, unless the lathe be specially designed for the purpose, the only alternative is to drive the lathe spindle from the leading screw through the train of chain wheels—in other words, the usual process is reversed, and put on the leading screw a pulley or other means of connecting it up with the most convenient countershaft.

Cutting a V Thread.

In cutting a V thread, the rest should be moved round 28 deg. for American threads, and 25½ deg. for Whitworth threads. This is half the angle of the thread—2, Fig. 1. When the cut is put on, the tool cuts on one side only, the other side merely scraping or taking a very fine cut. This gives a cleaner and faster cut than is the case when the tool rest is left at right angles to the lathe centres, as in the latter case, the tool cuts on both sides, which means a less cut and a rougher finish.

In putting on the cut, it will be found very convenient to run the bottom slide up against a stop, Fig. 1, stop 1. At every cut, by this means, we get the tool back in the same place as it was when we started the previous cut. Next, put on amount of cut required by the top slide. This saves any bother of keeping track of the graduations usually marked on the traverse screw, or the more cumbersome methods of chalking. Makers of lathes do not put these stops on any lathes that I have seen, but any machinist can easily fix them up for himself. A number of screws have to be made all alike, while an adjustable stop can be fixed on the top slide, which limits the amount of cut that can be put on Fig. 1, stop 2.

In a lathe job to cut 1,000 copper stays for loco. fireboxes, the rest was fitted with these stops. After making the first one a good steam tight fit, and adjusting the stops, the lathe was run at a high rate of speed, and there was no necessity to bother about graduations or chalk marks; besides, it was very seldom we had to put one back into the lathe a second time.

Cutting Square Threads.

In cutting a square thread, the shape of the tool is a very important factor, for, while the tool must have the necessary amount of side clearance or rake, to give it more weakens it and makes it more liable to break, neither will the cutting edge stand up to its work as long, if it is not the right shape.

The following rule gives every satisfaction for finding amount of rake or side clearance required:

Draw two lines at right angles to each other (A B) and (B C). From (B) and on the line (B C) scribe an arc whose radius shall be equal to 1½ times the diameter of screw to be cut. From (D) make a circle whose radius shall equal half the pitch, and draw a straight line, from where the two circles cut, to (B). This will give the angle or rake of the tool.

Mark off on a piece of tin or galvanized iron, and make a template, or, better still, make a gauge, as illustrated in Fig. 2. This would be useful to lend to the blacksmith, instead of having him guess at it, as he generally does. If a thread is to be made, and a nut to suit same, it is advisable to make the finishing tool slightly thicker at the root than it is at the point. This enables the nut to enter more readily. Another advantage, when the tool is sharpened by grinding the front cutting edge, is that it leaves it a little thicker, so that the sides can then be touched up.

A tool made this way smooths up the sides of the thread, and can be ground many times, and still retain its original size.

In a repair job, where a square threaded nut is to be made to suit an existing screw or vice versa, the apprentice needs to be reminded sometimes not to fit his tool into the space of the thread, but to take a pair of calipers and caliper the width of the thread, making the tool a little wider to allow the necessary clearance, and remembering that the tool cuts the space in which the thread fits.

Turn a narrow piece the width of the tool down to the size at the bottom of the thread before starting the first cut, as this saves a lot of time measuring. Leave the part to be threaded, at least the amount of the pitch longer, if at all possible, and turn it off after cutting to the depth required. This cuts away the fat or thick which usually occurs at the commencement of the cut, owing to the tool having no support at the back, until it fully enters the thread.

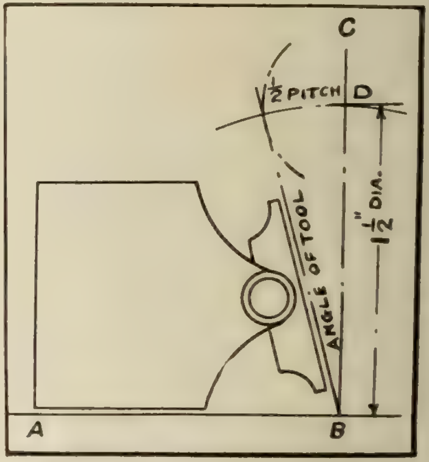

FIG.2.—TOOL SIDE CLEARANCE DIAGRAM

* * *

Recent experiments on the flow of air through smooth sheet steel ducts varying in size from 12 in. to 48 in. diameter, at velocities ranging from 1,000 feet to 2,400 feet per minute, appear to show that the average value of the coefficient of friction is 0.00035.

Removal of Refuse From Machines in Industrial Plants*

By F. R. Still**

The mechanical removal of refuse and waste material from workshop and factory floors, particularly in the vicinity of machine tools, etc., forms a prominent feature of many industrial plants of varied product. The phases of the subject dealt with in this article, are treated in an interesting and instructive manner.

REMOVAL of waste material from machines in industrial plants by means of fans or blowers has been in general use for over 70 years. It is the most efficient and satisfactory method known; yet even now the minimum velocity or volume of air required to convey substances of varying specific volumes and densities is not known to any definite extent.

Determining Pipe Sizes.

Naturally little was known about the proper design and proportion of hoods, so considerable confusion existed for years as to the proper pipe size, but in due course of time a standard size of pipe was generally adopted for a given duty on a machine of a certain type and capacity, and these sizes have become almost universal.

The way these sizes were arrived at was very crude. In those days it was generally supposed that the pressure pushed the stuff along. Nobody thought it was the velocity, and even if they had thought of it, they had no known method of measuring the velocity, as an anemometer would be quickly destroyed at such high velocities.

The Pitot tube for measuring velocity was not generally understood, and , in fact, it is only within the last six years that it has been developed to an extent that makes it an accurate or dependable instrument of measurement. Hence, the experimenters would put up a system of pipes, add the areas of the branches together to determine the size of fan inlet, and then try the fan at varying speeds, try different shapes and proportions of the hoods, etc., until the system seemed to work all right. Probably, the very next job would fail to work because the piping system was more extensive or the outlet from the shaving vault was too small, thus causing undue back pressure or some other of the many things which can happen around such plants.

The first thing always resorted to was to "speed up the fan." If it worked it was "a fine job." If, however, that did not prove effective, then the remote sections of the main pipe were taken down, the larger pipe moved along and supplanted by still larger pipe near the fan, a larger fan installed and larger branches to those machines which did not seem to have enough "draw" to them. After several similar experiences by the different builders of such equipment, they all gradually arrived at one standard size of branch pipe for a certain duty, and these sizes have been quite closely adhered to down to the present time.

Investigations and experiments should first determine what velocity is required to move different substances of varying weights and bulk. Then should be determined what proportionate volume of air is required to move, in a unit of time, a specific volume of different substances having varying weights and bulk. Air pressure is only a measure of velocity and resistance, beyond which it has nothing to do with the moving of material, as many suppose.

Relative Area of Substances Moved.

The relative area of a substance has a great deal to do with the ease with which it can be moved by air. For instance, a comparatively low velocity will move a cubic foot of powdered coal which will pass through a 100-mesh wire screen. It will take double the velocity to move a cubic foot of coal which will pass through a 25-mesh screen, but a centrifugal fan cannot produce high enough velocity to move a cubic foot of coal in a solid block.

The same is true of many other substances; take for instance shavings and dust from planing mill machinery. Twenty feet per second will move the lighter dust; 40 feet will move the shavings; 50 feet will move the sawdust, but there are knots, blocks, etc., which also have to be taken care of, and these sometimes require 60 feet or more per second. Hence the velocity has to be selected which will take care of the largest and heaviest pieces likely to enter the system.

From this it will readily be seen how essential it is for economical operation to know what is the lowest velocity required to move a given substance, as the frictional loss multiplies directly as the square of, and the power to drive the fan directly as the cube of the velocity. For example, if only 40 feet per second is necessary, and 80 feet is provided and at the lower velocity it requires 25 horse-power, it would require 200 horse-power at the higher speed. This is not an absurd comparison, as there are many plants where just such a comparative waste of power is taking place.

Velocity and Air Volume.

Frequently the velocity as predetermined may be correct, but the volume of air for the volume of material to be handled in a given unit of time may be sufficient. In other words, the ducts are too small. Hence the fan has to be speeded up to create a higher velocity in order to move the requisite volume of air. This has exactly the same effect on the power as would the velocity if it had been figured too high at first.

An example of this latter character came under observation about a year ago in one of the largest mills in the South. Six very large double exhaust fans were installed, driven by direct-connected electric motors. The planing mill machines, all high speed, had three or four times the surfacing speed of the older types; hence there was proportionately a greater volume of refuse to handle. The pipes attached to the hoods on the machines, being about the standard size, failed to take care of the refuse properly. The owners, having lost confidence in the contractor who installed the plant, sent in the plans with a request that they be advised as to the best course to pursue to put the plant in a condition which would be satisfactory to them.

A careful analysis of the situation showed it would require 438 horse-power additional to do the work with the existing plant by speeding it up; whereas, by revising the plant on a larger scale, proportionate to the work to be done, it would require 156 horse-power additional. Therefore, the saving would be 282 horse-power by changing the plant over. At the conservative figure of $40 per horse-power per annum, this would indicate a saving of $11,280, which, at 5 per cent., would represent the interest on an investment of $225,000. The owners of this plant had spent thousands of dollars experimenting on processes to utilize the waste from this mill for making various by-products, some of which have great value; hence they were more conservative about the consumption of refuse for fuel than many others in a similar line of work.

---

*From a Paper read before the American Society of Heating and Ventilating Engineers.

**Of the American Blower Co., Detroit, Michigan.

Selecting the Fan.

If the fan selected is a size or two larger than the sum of the areas would indicate, it will do the work when running at a very much slower speed, and will require less power. For example, suppose the plant requires a 12-inch main, which with the branches and separator offers a resistance of, say, 4¾-inch water gauge. If a fan having a 12-inch inlet should be attached it would have to run at about 1,865 revolutions per minute, requiring 5⅞ horse-power; whereas, if a fan having an 18-inch inlet were attached to produce the same velocity, it would only have to run at 1,040 revolutions per minute, requiring 5¼ horse-power. Thus the speed would be reduced 44 per cent. and the power reduced more than 10 per cent.

Piping.

Where the branch pipes attach to the main, they should enter at an angle of not more than 45 degrees and 30 degrees or less is better. Never attach a branch at right angles to the main. Two branches should never enter the main directly opposite each other; also avoid the use of Y-branches, as the two currents in conflict retard the flow, sometimes causing the pipes to clog.

Elbows should have a radius in the throat twice the diameter of the pipe. For example, a 6-inch pipe should have a radius of 12 inches in the throat. There is no advantage in making the radius more than twice the diameter. A right angle elbow in a 6-inch pipe offers as much resistance as a straight pipe of the same diameter 44 feet long.

With a radius of half the diameter, it is equal to a straight pipe 15 feet long; with a radius of one diameter it is equal to a straight pipe 5½ feet long, and with a radius of two diameters, it is equal to a straight pipe 2¼ feet long.

Friction of Piping.

By making the radius more than twice, the resistance begins to increase again, until, at six diameters, it is equal to a straight pipe 3 feet long. This is due to the greater distance the air is under compression on one side of the pipe while making the turn.

Friction of the air travelling through the pipes is another and very essential point for consideration, and it must be determined in order to know the minimum speed at which the fan can be run. Careful experiments have shown that a length of round pipe from 62 to 72 times its diameter will produce friction equivalent to the velocity head, the shorter length applying to small pipes, because of the relatively greater resistance the roughness of the surface presents per unit of volume. In actual practice it is customary to allow about 40 diameters to compensate for branch tees, reducers, dents, etc. The refuse carried along by the air also increases the resistance somewhat.

Rectangular pipes can be compared with round pipes by multiplying the area of the square pipe by four, and dividing by the perimeter of the square pipe; the result is the corresponding diameter of a round pipe for the same velocity. The friction for varying diameters of round pipes is inversely proportional to their diameters at a given velocity. The friction of rectangular pipes at the same velocity varies inversely as the square root of their respective areas, and the friction of any pipe is directly proportional to its length.

Due to Small Pipes.

In the application of fans to the removal of smoke, fumes, fine dust, obnoxious gases, etc., great care has to be exercised in so designing the hoods that they will not interfere with the process, that they will not be in the way of the mechanics, and still be capable of catching the floating material before it gets into the room. Most failures in such installations are due to the pipes being too small.

For example, suppose a hood of conical form is 3 feet in diameter at the mouth, with a 7-inch pipe attached at the top. With a velocity of 4,000 feet per minute in the 7-inch pipe, the velocity is only 151 feet at the mouth, or less, about 2.5 feet per second.

A very efficient though somewhat expensive hood of this type is to put one hood inside the other, leaving about ⅜-inch space between, all around the bottom, and then run a nozzle from the apex of the inner cone up into the pipe which is attached to the outer cone. The nozzle should be about half the area of the pipe. With such a hood, anything that rises up into it cannot escape around the rim even if it is not drawn off by the central connection.

A common rough rule for determining the diameter of pipe for round conical hoods is to make the bell-mouth one foot larger in diameter than the apparatus it is to cover, and increase this diameter one foot for every 2 feet elevation above 2 feet; then to make the pipe one-sixth the final diameter of the mouth as thus determined.

How to Secure Humanized Office Efficiency *

By Leon Orr Fisher **

In the office as in the works, opportunity for the application of efficiency principles and ideas can readily be found, and in the various directions indicated by the writer, there exists ample scope for the display of effective practical and highly remunerative effort.

OFFICE efficiency is secured in much the same way as the mechanical engineer secures efficiency in the factory—namely, by working with and applying engineering principles, such as:

(1)—The study of physical conditions and determining in what way the office or physical plant helps or hinders production.

(2)—The elimination or reduction of waste or duplicate motion or effort by any means, methods or machines.

(3)—The positioning of groups of workers or departments with reference one to the other, with a view to securing direct forward action, so that the work received at one point will go continuously forward to its completion; and, in the same way, similar positioning of the workers, individually or in units, to accomplish the same result within each department or group.

(4)—The application of ingenious schemes and methods whereby, through the modification of existing methods, or the combination of several forms or lines of work, one effort can be made to produce one, two, three, four, five or more results, thus getting numerous by-products of the single effort.

(5)—The reduction, as far as possible, of memory work to a record basis, and hand work to a machine basis, thereby augmenting the capacity of every intelligent employe by increasing the time at his disposal for brain work, and decreasing the time wasted in leg work and hand work.

The Humane Feature.

While we are primarily seeking increased efficiency and, as a necessary result the truest kind of economy, we are also working humanely for the benefit of the men and women engaged in this class of work, because physically we are relieving them of many of the burdens which, under old methods, made them merely drudges and routine workers, and mentally we are raising the standard because of the increased opportunity to employ brains rather than brawn. In other words, office efficiency depends upon individual efficiency, which, as we understand it, does not mean a rushing, nerve-racking, high-pressure service, but the energetic, orderly and intelligent use of each moment of the working day, and the employment of every means, method or mechanical appliance that will secure increased and improved production. In order to see how the physical condition of an office in its arrangement may be best adapted to promote the efficiency of the employees, we must consider:

---

*From a recent address before the Efficiency Society, New York, in the Efficiency Magazine.

**Third Vice-President, Equitable Life Assurance Society.

Considerations to be Accounted.

(1)—That an office is a working tool and not merely a place in which to hive so many workers.

(2)—The space must be adequate, not only for the present, but with a reasonable margin for probable growth within a period of from three to five years. One of the most serious handicaps to office efficiency is the assignment of inadequate space to any branch of work and the necessary rapid disorganization brought about from changes which must be made to accommodate growth—these changes in turn disrupting the proper location of desks and files and encroaching upon necessary aisle space, also thrusting the workers into aisle space and causing loss of proper working space in front of files, etc. All of this results in cluttering up an office, the loss of its orderly arrangement and in an unconscious effect upon the clerks, causing them to become careless and unsystematic.

Practical Suggestions.

In considering the requirements and division of space and floor plan in arranging an efficient office, there are some suggestions which perhaps may be of practical value. For instance, a man at a standing desk, where other clerks are obliged to pass and re-pass him, should not be expected to work in less than 36 inches of aisle space, and if two are working back to back, there should be a minimum of 42 inches between desks. It might be stated right here that the better results are obtainable when all desks are arranged so that the clerks face the supervisor.

Where ordinary desk workers are placed in rows, there should be at least 42 inches from the working ledge of one desk to the face of the next desk back, in order to give proper space for the clerk to find chair room and provide aisle space back of the chair. Ordinary aisle space used as a thoroughfare should be at least 3 feet wide. The working space, in front of any file constantly referred to, should be at least 5 feet, and in relation to the general work-rooms of large concerns, experience has proven that the adequate space essential for each clerical worker is a general average of from 100 to 115 square feet, including provision for desk, chair, aisle space and room required for files and equipment.

In order to have an office flexible and adjustable to growth and changes, it is exceedingly desirable that there should be as few solid walls and as few partitions as possible, as these interfere with enlargement or change. It is hardly necessary to call attention to the great advantage, in connection with problems of supervision, of having the partitions, where used, of glass, and clear glass at that.

Light.

(3)—Next in importance to space are the twin questions of light and ventilation. Overhead lighting, in my opinion, is preferable to individual desk lighting from the point of view of securing a flexible office, permitting the maximum number of changes necessary at a minimum expense, improving the appearance of the office and conserving the eyesight of the clerks. The Curtis Publishing Co., of Philadelphia, after making an exhaustive study, in conjunction with professors from the University of Pennsylvania and leading oculists, opticians, and others interested in this subject, not only from an electrical engineering point of view, but from a psychological aspect, decided to install an indirect method in their important clerical work-rooms in order to get a thoroughly diffused soft light, the equivalent (as near as possible) of daylight.

Ventilation.

A close second to the question of light, in importance, is certainly that of ventilation. Every practical man has undoubtedly had a demonstration of this as early as 2.30 or 3 o'clock in the afternoon, if not earlier, when work-rooms not properly ventilated produce that peculiar effect upon the clerks which causes many of them to leave their desks with papers in their hands, and walk about from desk to desk or from floor to floor, without being able to give a plausible excuse for so doing. The real reason is that the air has become vitiated, the clerks have become sluggish, and the desire to work has vanished.

It is hard to state this proposition in percentage, but it is certainly conservative to say that this lack of ventilation in the majority of offices may be roughly stated as representing a loss of at least 25 per cent. of efficiency to the working force after 2 p.m. To my personal knowledge, this has been the determining factor in many insurance offices in deciding on early closing, on the score that practically little or no work is done after 4 o'clock in the afternoon, owing to the mental condition of the clerks due to the lack of sufficient fresh air in the offices. When our company moved to 2 Albany Street, with plenty of air and light, our efficiency increased at least 25 per cent.

The Building Equipment.

Unfortunately, an office depends largely for its efficiency upon the physical conditions imposed by its buildings. The space must be adequate and the force must be stationed with a view to the passing of the work; that is, the different groups of workers must be made to cog in with one another and create a smooth-working machine. Careful study must be made to avoid unnecessary floor travel. Mechanical appliances must be used to bring all the workers into closest proximity with one another by elevators, dumb waiters, mechanical pick-up and delivering devices and adequate and effective interior telephone service. Long corridors, intervening courts and lightwells, fire walls and fire towers and intervening elevator shafts and other building necessities must be carefully studied in this connection.

The location of vaults, store rooms, lavatories, wash-rooms, cloak-rooms and rest-rooms must all be studied with a view to keeping the working forces intact and preventing the considerable element of wasted time at the beginning and close of each session (morning and afternoon), as well as the absences which will creep in unless these matters are carefully considered.

Dressing and Toilet Rooms.

In a large force of several hundred or several thousand, it makes a great difference whether the clerks' time begins when they enter the building with wraps on, or whether their time begins when they enter the work-room ready for business, the arrangement of the office being such that they can put their hats and wraps in their lockers before registering their time. A stenographic department should have proper lavatory facilities so that soiled hands can be washed without leaving the room.

A considerable percentage in the actual working time of any clerical force is saved if toilet facilities are on the same floor and not several floors away from the work-room floor. It also means a great deal if vaults needed by any division are a part of the physical equipment of that division, and it is not necessary for clerks to leave their own work-room to refer to records in the vaults.

Employees Sub-division.

I might state that in our office we divide our clerks into several classes, namely:

Boys,
Junior clerks (male and female),
Senior clerks (male and female),
Special clerks (male and female),

Supervisory and technical (male and female), with some recognized sub-divisions under some of these headings, such as typists, copyists, phonographers, adding machine operators, multigraph operators and addressograph operators. Beyond all these classes are department or bureau heads, junior officers and executives.

We have studied the work of each class, and have established a system of minimum and maximum compensation, which permits the employment of clerks at a proper and reasonable initial salary, and gives them, while continuing in the same class, an expectation of increased compensation based upon merit and length of service, the understanding being that compensation beyond these maximums must be secured by promotion. We are endeavoring to provide ways and means for the education of the clerks of one class so as to make them eligible to enter the classes above them.

Specialization of Clerical Activities.

As to how far specialization of clerical activities should be carried, I would state that this is too broad a subject for more than mere mention here. I am a great believer in specialization; in fact, to my mind that is what complete organization requires. The work of each division must be analyzed, and the work properly distributed among those who by specializing are enabled to handle the largest possible volume in the shortest possible time, and with the smallest possible liability of error, and also to fix responsibility for work done.

There is, however, a point of safety beyond which specialization cannot be carried, in that we must have understudies to each and every position, so that the resignation, vacation or absence from any other cause will not handicap the work, and in order that we can, at all times, be prepared to make promotions; therefore, we do specialize in every department, but within well-defined limitations.

We are seeking to create conditions with insurance- co-operative store, rest rooms and other welfare work, both physical and mental, which will enable our clerks to give their undivided time and thought and best efforts, with a feeling of contentment in their position and loyalty to and pride in their company. I believe contentment of mind is the secret of good work.

Misfit Elimination.

Finally, I would say that the real secret of office efficiency lies in the human factor—the right man or woman in the right place. The first selection must be made intelligently, for we cannot make "silk purses out of sows' ears." The standard first established must be maintained, and this means proper methods for the development of the fit, the discovery of the unfit, and a continuous process of elimination of the latter. The supervision must be right; the administration just.

Our problem in office efficiency is to combine the best workers, best tools, and best supervision to get the best results in the least time, and at the least cost. There is nothing so dear as cheap help; nothing so cheap as really efficient workers.

The Chatter Mark Feature in Grinding Operations

The relation of wheel speed and work speed, and its effect in surface grinding—One cause of chatter marks and how to correct it.

CHATTER is the name applied to the phenomena which is sometimes present during a grinding operation, and when we remove the work from the machine, it is seen that the surface produced is not uniform, but uneven. This unevenness is referred to as "Chatter Marks." Another name for chatter marks is "Flats." This name is not strictly correct, because if applied to cylindrical grinding wrok, it conveys the idea that the flat places have been produced in the work, which is really not the case. On cylindrical work, chatter marks are really curved surfaces.

Causes of Chatter Marks.

There are various causes for chatter marks, the most prominent of which is vibration in the work. This in turn can be due to a number of causes, among which may be mentioned lack of rigidity in the machine on which the work is being performed, or intermittent work speed, which may be the result of wearing of the gears in the headstock, if the machine is gear driven; or if the work is directly driven by a belt, chatter marks may be produced by the intermittent motion applied to the work through the belt.

The cause of chatter marks can sometimes be laid to the grinding wheel. If the wheel is running out of balance, chatter marks will be produced. If the wheel bearings are not properly adjusted and there is considerable play present, chatter marks will be produced on the work. However, in cylindrical grinding, chatter marks which can be traced directly to vibration or out of balance of the wheel are not of the same variety as those originating with the work. Chatter marks caused by the work not revolving as it should are uniform, that is, the spaces between them are of equal distance; while chatter marks which can be traced directly to the wheel are irregular.

Different Wheel Speeds.

The two illustrations shown are of surface grinding. Figs. 1 and 2 are of the same piece of steel, ground on the same machine, with the same table traverse; hence, production per minute was constant, but there were different wheel speeds. In Fig. 1, the speed was 1,300 r.p.m., while in Fig. 2, it was 1,000 r.p.m.

We can consider production per minute to be made up of two factors, the number of chips produced and the average size of each chip; that is, if we should figure out the number of chips produced per minute, and determine their average size, the number of chips multiplied by the average size of each would give us the production per minute.

Let us take the situation where the wheel speed was 1,300 r.p.m., as a basis; then at 1,000 r.p.m. we have a decrease in speed of about 23 per cent. Now, the number of chips produced per minute is determined by the number of cutting teeth on the wheel's face times the number of revolutions which the wheel makes

FIG. 1.—SURFACE WHEN RELATION OF WHEEL SPEED TO WORK SPEED IS INCORRECT.

per minute. Therefore, at 1,000 r.p.m we have 23 per cent. fewer chips cut off in a minute than at 1,300 r.p.m. and since production remains constant, each chip must be 23 per cent. larger at 1,000 r.p.m. than at 1,300 r.p.m:

Cutting off large chips brings more pressure to bear on each individual cutting tooth than is brought to bear when a small chip is cut off, so that large chips will have a greater tendency to tear out cutting teeth from the wheel than would small chips. In other words, the wheel would wear enough to keep it cutting freely when producing large chips.

This is the condition which was present at 1,000 r.p.m., namely, enough pressure was being brought to bear on each cutting tooth so that the wheel wore enough to keep it free cutting, while at 1,300 r.p.m. there was not enough pressure on each cutting tooth of the wheel to tear out that tooth when it became dull. The wheel was then in a glazed condition; it did not cut freely and caused all kinds of trouble, such as intermittent motion to the driving belt, with the result to the work shown in Fig. 1.

At the time that this phenomena was observed, the particular machine on which the operation was performed was not adjusted for a faster table speed than was used for Fig. 1. Later, however, the machine was readjusted so that a faster table speed could be obtained, and just as satisfactory work as is shown in Fig. 2 was obtained with 1,300 r.p.m., wheel speed and a faster table traverse. In other words, in order to eliminate chattering on surface grinding, it is necessary to bring a certain amount of pressure to bear on each individaul cutting particle by making it do a certain amount of work in a given time, so that it will be torn away from the wheel before it has had the chance to become dull, and produce the phenomena shown in Fig. 1.

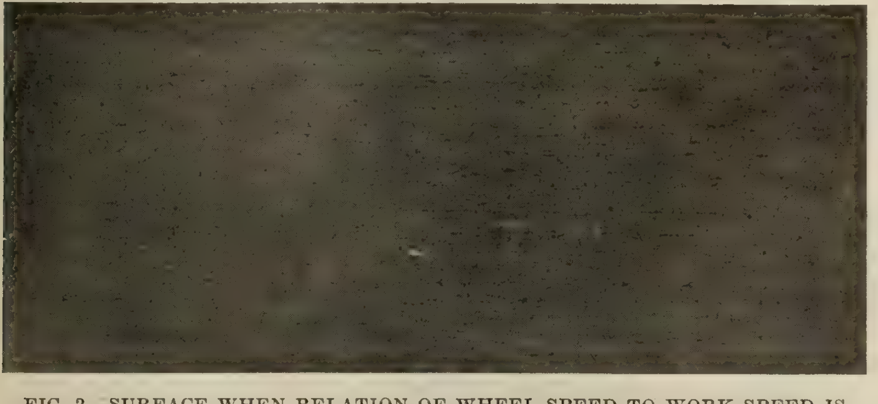

FIG. 2.—SURFACE WHEN RELATION OF WHEEL SPEED TO WORK SPEED IS CORRECT.

If the machine itself had been at fault, we could not have obtained satisfactory work at the higher table speed, because, as the amount of material cut off per minute, in other words the production was increased, our power must have increased likewise, and if the machine were at fault from the point of view that it was not powerful enough for the operation, we would have had a case of worse chattering than that shown in Fig. 1. The direct cause of this kind of chattering is, undoubtedly, local heating, but the indirect and most important cause is the fact that we have an improper relation between the wheel speed and the amount of material removed per minute for this particular grain and grade of wheel.

We are indebted to the Norton Co., Worcester, Mass., for the cuts and data contained in this article.

* * *

COBALT HIGH SPEED TOOL STEEL.

IN a recent issue of Stahl and Eisen there appears an account of the tests carried out at the Royal Technical High School, Berlin, on Cobalt high-speed tool steel. Of special interest, says The Iron Age, is the composition of one particular Cobalt steel. For the sake of comparison, the analysis of one of the ordinary high-speed steels used in the tests is also given. They are as follows:

	Cobalt steel "U," per cent.	High-speed steel "N," per cent.
Carbon	0.76	0.88
Silicon	0.28	0.28
Manganese	0.10	0.07
Phosphorus	0.010	0.018
Sulphur	0.032	0.036
Copper	0.06	0.07
Nickel	trace	0.06
Cobalt	5.03	None
Chromium	4.38	5.09
Tungsten	16.40	18.10
Vandium	0.62	1.16
Molybdenum (about)	0.30	0.60

The author states that the percentage of cobalt in this sample is rather high. It is interesting to compare the record of the results of these two steels in the series of tests. Each steel was made to cut hard chrome-nickel steel of 65 tons tensile strength in a lathe, until the tool was dull, at a speed of 83 and 66 ft. per min. with a feed of 1 mm. per revolution, and a cut of about 4 mm. thickness; and mild steel of 31 tons tensile strength in the same lathe, at a speed of 83 ft. per min., with a feed of 2.5 mm. per revolution, and a cut of about 10 mm. thickness; also cast iron of about 10 tons tensile strength, at a speed of 100 ft. per min., with the same feed and cut as the mild steel. The results of the tests under these conditions of the two steels referred to already are as above, including one other cobalt steel which ran unusually high.

	On Chrome nickel steel				On mild steel		On cast iron	
	83 ft. speed		66 ft. speed		83 ft. speed		100 ft. speed	
	min.	sec.	min.	sec.	min.	sec.	min.	sec.
Cobalt "U"	5	6	13	54	6	22	9	55
High speed "N"...	1	47	5	20	2	52	1	25
Cobalt "S"	5	26	25	36	..	..	..	..

High speed steel "N" is chosen for the above table as the one out of the number shown in Professor Schlesinger's tables which gave the best results of the ordinary tool steels. The end of each test was determined by the dullness of the tool, ascertained scientifically. To make the comparison complete, the value of each grade of steel was determined by dividing the endurance value by the price. The result of this on the hard chrome-nickel class, in the case of the three steels mentioned, was as follows:

	On chrome-nickel steel at 83 ft. speed	66 ft. speed
Cobalt "U"	40.80	111.50
High speed "N"..	7.93	23.70
Cobalt "S"	43.50	205.00

Professor Schlesinger concludes his aritcle with the statement that the application of cobalt to the production of high speed tool steels exerts a marked influence in enhancing the value and endurance, without raising the cost price over the average market price.

DEVELOPMENTS IN MACHINERY

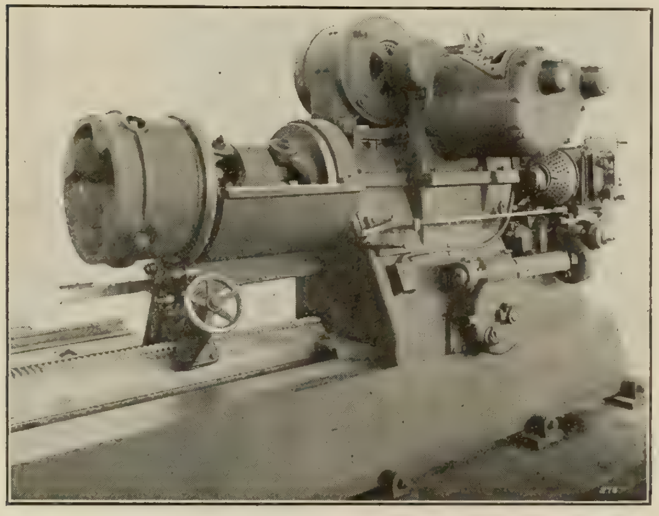
A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

HEAVY CYLINDRICAL GRINDING MACHINE.

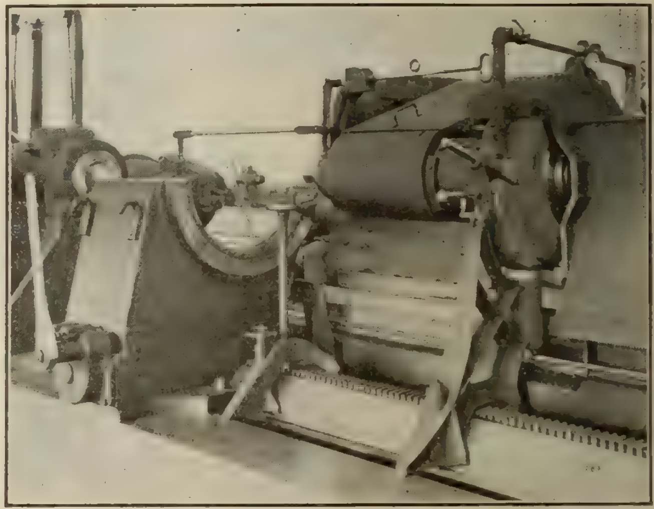
THE Norton Grinding Co., Worcester, Mass., has designed and built a heavy cylindrical grinding machine to swing 54 inches in diameter, and to grind work 18 feet in length. It has a capacity of 21 feet centres, and can be furnished to take any desired length between centres.

Equipment.

As will be noted from the illustrations, this machine is equipped for grinding heavy rolls, but can be supplied without this special equipment, being then suitable for grinding plain cylindrical work on centres up to its capacity.



Near view of headstock of Roll Grinding Machine, showing universal joint, locater and driving sleeve.



Near view of journal rests with trammel for setting bronze shoes for correct diameter, and radial trueing device for shaping the corner of the grinding wheel for grinding fillets

Power.

The machine is arranged for motor drive only, the equipment being as follows:

One 40-h. p. motor mounted on the wheel carriage, for the revolution of the grinding wheel and wheel carriage traverse.

One 15-h. p. motor mounted on the headstock, for work revolution.

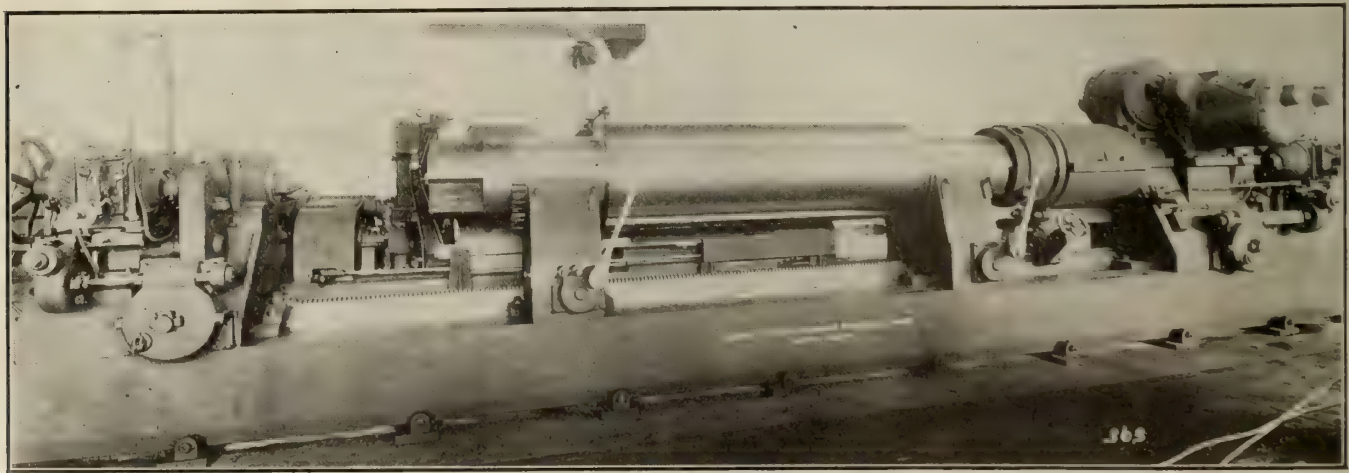
One 2-h. p. motor on the footstock, for traversing the footstock along the ways of the work base.

One 2-h. p. motor on the headstock, for traversing the headstock along the ways of the work base.

One 2-h. p. vertical motor upon the wheel carriage, for the pump revolution, and traversing of the grinding wheel at right angles to the work.

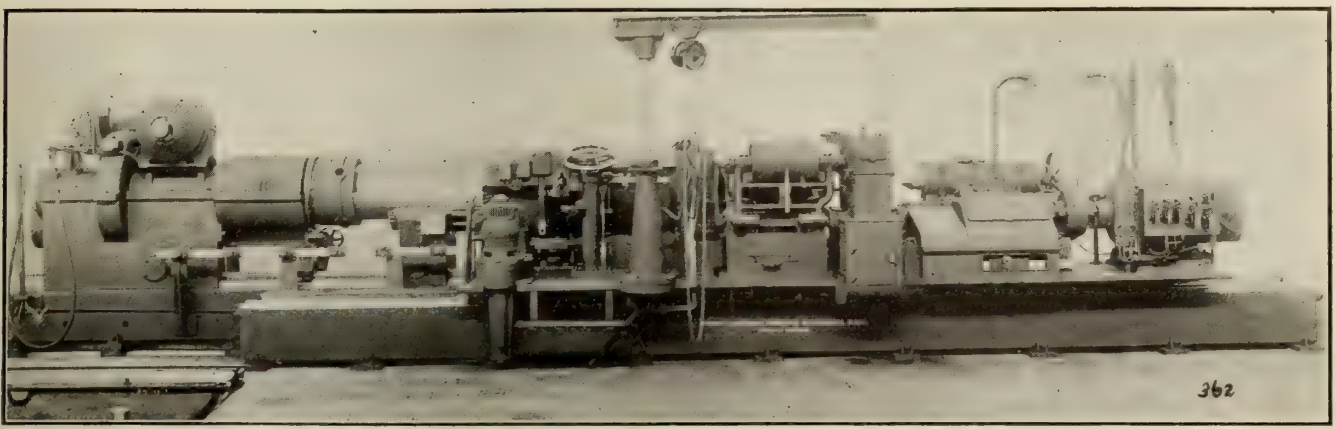
Control.

The machine is controlled from one position, the operator standing upon the wheel carriage beside the grinding wheel so that he can look directly down between the face of the grinding wheel and the face of the work which is being ground, and can see what is taking place at the point of contact between the grinding wheel and roll. Standing in this position, the operator can reach all of the hand wheels and levers necessary for starting and stopping the wheel revolution, starting or stopping the roll revolution, reversing the traversing wheel carriage either by hand or by power, moving the wheel carriage for delicate adjustments by hand, moving the wheel to and from the work either by hand or by power, starting or stopping the traverse of the wheel carriage, changing from



REAR VIEW OF ROLL GRINDING MACHINE, SHOWING ROLL IN POSITION FOR GRINDING.

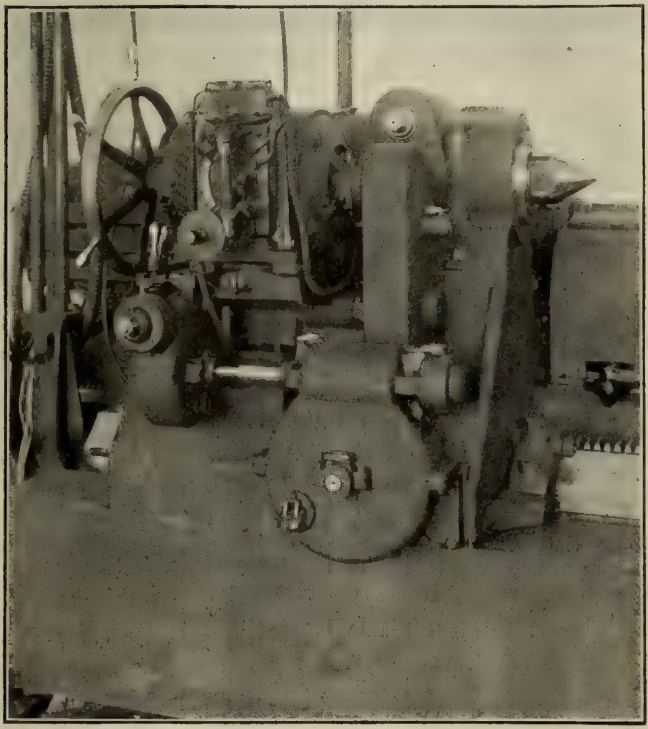
maximum to minimum speed of the wheel carriage traverse, and controlling the amount of water or lubricant flowing over the wheel and work.



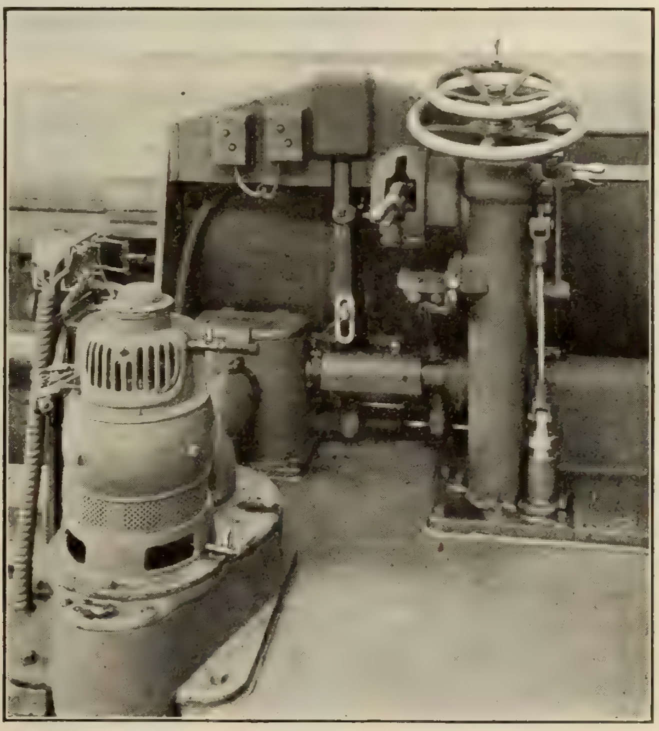
IEW OF ROLL GRINDING MACHINE, SHOWING ROLL IN POSITION FOR GRINDING.

Referring to the illustrations, the operator uses the upper hand wheel for feeding the grinding wheel toward or from the work; one revolution of this hand wheel moving the grinding wheel a distance of .040 inches, corresponding to .080 inches reduction in diameter of work. If the grinding wheel is to be moved by power, the above hand wheel is disengaged by moving the lever at the right of the hand wheel toward the operator, and locking the lever in this position. This raises the hand wheel, disengaging it from the wheel feed mechanism, and at the same time releases the wheel traverse lever at the lower left-hand side. Moving the wheel traverse lever to the right or left operates a clutch, resulting in a movement of the grinding wheel either towards or away from the work.

These levers are so constructed that the power traverse cannot be thrown in until the hand wheel has been disengaged; nor can the hand wheel be engaged until the power traverse levers have been thrown out of engagement. The lever at the upper left-hand side of the hand wheels controls the stopping, starting and reversing of the wheel carriage. When automatic traverse of the wheel carriage is desired, this lever is placed in its lowest position. With the lever in the next higher position, the wheel carriage can be reversed or stopped by hand. With the lever in its upper position it engages the lower hand wheel with wheel carriage traverse mechanism, permitting movement of the wheel carriage by hand. The changes in speed of work revolution are accomplished at the headstock with change gears. Intermediate speed changes for traverse of wheel carriage are made on the front of this carriage.



Near view of footstock of Roll Grinding Machine.



Near view of control of Roll Grinding Machine.

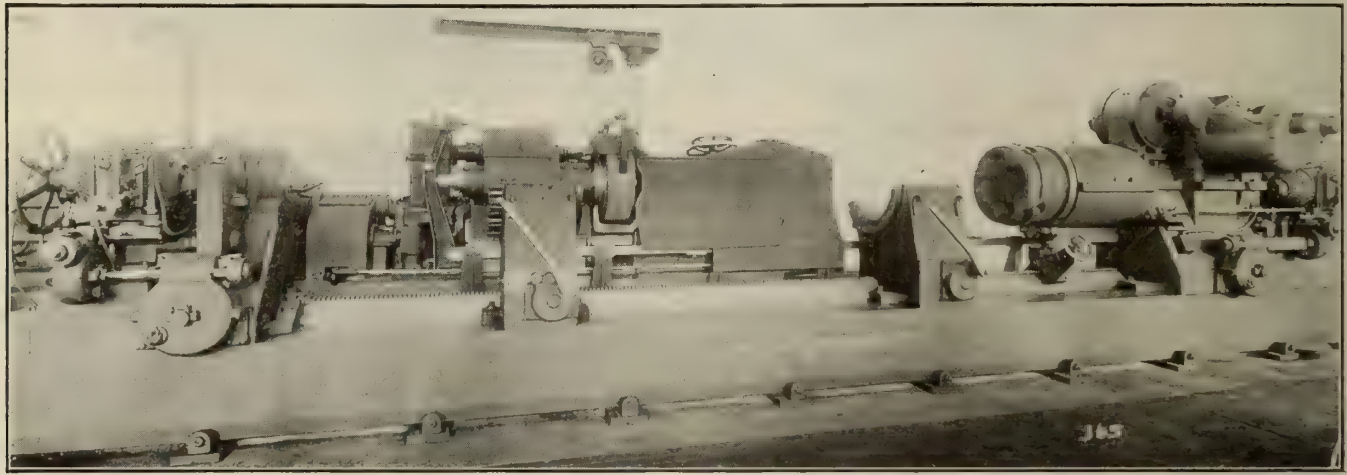
Ways and Maintainance of Alignment.

As this machine is designed for very large work, it is imperative that the ways in which the wheel carriage travels should be perfectly straight, and to obtain this feature, the Norton Pendulameter is used. This instrument permits the detection of errors as small as .001 inch at any point along the ways as related to parallelism and straightness. The ways are then scraped to master straight edges until the pendulameter registers a perfectly straight line.

It will be noted from the illustrations that the machine is provided with supporting wedges which are self-contained so that the alignment of the ways can be corrected at any time, but the width and length of the bearing of the wheel carriage being so ample, it is very improbable that, with the machine once set and adjusted for correct alignment, any error can be detected after many years of use.

Single Wheel Design.

Years ago, Mr. J. Morton Poole invented the double wheel machine with a swinging frame to secure accurate diameters over the entire length of the roll, for the reason that at that time there were no known methods for producing and maintaining straight ways of sufficient accuracy to secure perfectly straight lines or uniform diameter of roll with a single grinding wheel.



REAR VIEW OF ROLL GRINDING MACHINE, SHOWING ROLL REMOVED FROM BEARINGS.

The machine herein described is designed and constructed in accordance with the experience of recent years, viz.: That it is wholly practical to produce and maintain ways for a single grinding wheel which will secure absolutely perfect rolls, and, incidentally, the advantage of this single wheel is that, with the present design, it is possible to have the wheel large in diameter and of wide face, so mounted and provided with powerful drive as to permit the grinding, in a few hours, of rolls which formerly required a day or days for their grinding. Further, it is more convenient to place heavy rolls in the machine, or remove them, than is the case with a machine equipped with the double wheel.

Under the old system, a roughing cut was unknown. All cuts were practically finishing cuts, and hours, in fact days, were spent in the slow process of grinding with small wheels, not exceeding 14 inches or 15 inches in diameter, and not over 1 inch or 2 inches in width, while relatively small spindles and frail supports were provided for the carrying of these wheels.

In designing this machine, two objects kept in view have been accuracy and large production. The older line of double wheel roll grinding machines have produced accuracy at the expense of time. With the single wheel machine of modern design, advantage can be taken of greater weight and power securing accuracy and at the same time large production.

Production.

The first roll grinding machine of the type described in this article was shipped to a well known concern for grinding rolls to be used in the rolling of steel plate. The rolls are of various diameters and lengths, but the largest roll the customer expects to grind on this machine is 34 inches in diameter by 18 feet in length over all, although rolls 54 inches can be ground if desired. It will be noted by reference to the illustrations that the machine is equipped with massive pillow blocks and bearings for carrying the rolls upon their necks, the largest of these necks being 24 inches in diameter.

During the demonstration of this machine, rolls were ground in from one-fourth to one-half the time previously required for finishing the same rolls in the lathe. As yet there has not been sufficient time in which to definitely establish the conditions under which the machine will give the greatest output, but there is every reason to expect that greater savings will be shown after the machine has been longer in commission.

General Description.

The original design of Norton Plain Grinding Machines has been departed from in this case, for the reason that the work to be ground is of such size that in order to see the point of contact between the work and the grinding wheel, it is necessary for the operator to have control of the machine on the same side of the work as the wheel is grinding. He does, however, as in the standard machine, have entire control of all of the important functions of the machine while standing in one position, and without reaching over the work.

To secure perfectly smooth work, the rolls are revolved through helical gears, and large worm and worm wheels running in a bath of oil. Six speeds of work revolution are provided. The headstock spindle is 12 inches in diameter, the footstock spindle is 10 inches in diameter, the centres are 6 inches in diameter and are interchangeable.

When grinding rolls carried on their necks, they are revolved by means of a large universal joint, in order to give a steady and uniform rotation of the work, one end of the universal joint being bolted to the face plate of the headstock spindle. To the other end is bolted a driving sleeve which clamps solidly to the wabbler end of the roll, revolving as a part of the latter. The driving sleeve and universal joint are steel castings.

When grinding work on centres, the universal joint, the universal joint case, and the driving sleeve are removed, and a driver is bolted direct to the face plate on the headstock spindle.

The wheel head with its spindle, wheel guard, wheel sleeve and wheel, weighs over 5,000 pounds, and rests upon a solid wheel head base mounted on the long, heavy traversing wheel carriage, making it possible to grind the roll rapidly.

Provision is made for grinding the necks of the rolls either when carried on the machine centres or when the rolls are revolved upon their necks in specially arranged bearings, and machines can be supplied either with or without the footstock, the footstock not being necessary for grinding the roll necks, it being entirely practicable to grind rolls both on necks and bodies when carried in these specially arranged bearings.

The pillow block bearings for use in

grinding the necks, are arranged with multiple bronze bearings which are adjustable for the small variation in the size of necks, a pillow block being required for each standard size, the adjustment taking care of the variations from the standard. Perfectly round necks are guaranteed whether or not there are centres in the roll. A trammel is provided for adjusting the roll neck bearings to correct diameter, before the roll is placed in posi-
trammel being shown in one of the illustrations.
tion for grinding, the design of this

Fillets on the roll necks can be ground with the same wheel, and at the same time as the necks are ground. A forming attachment is also furnished, which is adjustable for any radius for the forming of the corner of the grinding wheel when fillets are to be ground. A truing device is also furnished for truing the face of the grinding wheel. The pump delivers about 30 gallons of lubricant per minute on the wheel and work.

Materials of Construction.

The materials in this machine are all high grade. The castings contain 20 per cent. steel, giving a very close grain casting of good wearing qualities. The wheel spindle is of the best chrome nickel vanadium steel, heat treated to a hardness which gives it extraordinary wearing qualities. The grinding wheel sleeve is a steel casting, as is also the wheel guard, this guard weighing 600 pounds. The shafts are made of the best carbon steel and carefully ground to size. The worm and worm wheels are of best procurable material for the purpose, and were made by the Brown & Sharpe Mfg. Co.

Helical gears in the headstock are of steel, as are also many of the other gears in the machine, where strength and durability is required. All racks are of solid steel. The pillow blocks for roll necks are steel castings, while the adjustable bronze bearings in these pillow blocks have been specially selected. The adjusting wedges under these bronze bearings are of high-carbon steel.

All bearings, where necessary, are self-oiling. All oil holes are covered with a small iron cap which cannot be easily broken off, but is easily seen by the operator. All oil holes are of ample size. When desired, an attachment can be supplied which will permit the grinding of rolls with either a concave or convex face. The machine as shown in the illustrations is arranged for grinding rolls either straight or with straight tapers, whether or not the rolls are carried on centres when being ground. The equipment, as shown, for grinding rolls, weighs about 100,000 pounds.

AN ULTIMATE NECESSITY.

ELECTRIFICATION of steam roads is an ultimate necessity. Progress is, however, slow. It has been absolutely shown that electrification, particularly at points of heavy traffic, saves 25 per cent. to 35 per cent. in operating charges. It is the initial expenditure that causes every manager to hesitate. The average estimate runs close to $5,000 per mile.

Railroad men were slow to accept the merits of electric operation, but experiences of the great lines successfully conducting suburban zones have at last brought conviction. The saving has been demonstrated, flexibility of service and added comfort of passengers is admitted. It is now a question of capitalization, and uncertainty as to limitations that governing commissions might impose.

A DEFINITION OF SCIENTIFIC MANAGEMENT.

IN a recent issue of the Journal of Political Economy, scientific management was thus defined:

(a)—It is a definite working policy applicable wherever human effort is put forth.

(b)—It is the introduction of the laboratory method in everyday affairs.

(c)—It is the acceptance of the dictates of science, instead of those of personal opinion and tradition.

(d)—It is the establishment of the fact that not to know is no crime—that the crime is not being willing to find out.

(e)—It is a type of co-operation more intensive than the world has yet seen.

(f)—It is filling in—not bridging — the chasm between capital and labor.

(g)—It is making our industrial life square up with the best we know in our personal and social relations.

(h)—It involves a very radical change in the attitude both of the men and the management to the work on which they are mutually engaged.

BOILER MANUFACTURERS' CONVENTION.

THE American Boiler Manufacturers' Association will hold its 25th annual convention in Cleveland, Ohio, September 1 to 4, inclusive, with the Hollenden Hotel as headquarters. This convention will prove of special interest to boiler and tank manufacturers and steel plate users in consequence of the proposed adoption of the standard and uniform boiler specifications, also from the fact that it celebrates the silver anniversary of the association. As Cleveland is centrally located, a large attendance is expected from Canadian and United States manufacturers and allied interests. The local committee have provided an excellent program of entertainment for the visiting ladies, and an excursion on the lake on Wednesday, September 3rd, for members and guests, has been arranged. The convention will conclude with a banquet on Thursday evening, September 4. All manufacturers and users of steel plate are invited to attend the convention and reservations for rooms should be made at once. M. F. B. Slocum, of the Continental Iron Works, Brooklyn, N. Y., is secretary.

MANUFACTURE OF CORRUGATED TUBES.

A NEW process for the manufacture of corrugated tubes has been patented by a Polish engineer. By this method, it is possible to corrugate either standard wrought iron or steel tubes, the corrugations being made by pressing the material together in a special machine. Ordinary steel tubing or lap welded and re-rolled tubes are used, according to the pressure and size required. One of the special features of the process is that although the tubes are shortened by the process, the corrugations are pressed into them at equal distances apart without decreasing the original internal diameter, and at the same time the wall thickness is uniform and the same as it originally was.

These tubes, it is claimed, can be made in all sizes from diameters of 1⅜in. up to 18in., the average length being about 12 feet. In very long lines, the tubes can be partly corrugated. The tubes possess considerable elasticity, which is, of course, an advantage in steam pipe lines.

LOW WATT CONSUMPTION LAMP.

THE latest development in connecnection with a low watt consumption per candle-power is reported from Germany, where, according to the Electrical Review, the A. E. G. intends to place on the market in the autumn a new lamp which is claimed to consume only one-half of a watt per candle, as compared with .8 watt to 1 watt per candle of the existing wire lamps. It is announced that another firm, which manufactures Osram lamps, will also introduce a lamp having a similarly low watt consumption. The figures, of course, refer to the Hefner candle, which has a value about 10 per cent. less than English candle.

◆

LOOSE HEADSTOCKS—RIGHT AND WRONG.

By W. Crawdon.

WHEN using the cross adjustment of a loose headstock of a lathe to correct the alignment of the centres, or for turning taper work, there is a tendency for the loose headstock to be pushed backwards on the bed when the headstock is made as shown in Fig. 1, owing to the weight of work on the taper centres. This sometimes results in injury to the workman, on account of the job falling out. It will be seen that to make the cross adjustment it is necessary to slacken the clamping bolts which leave the headstock free to slide on the bed.

A better design of loose headstock is shown in Fig. 2, and in this case it will be noted that the set-over portion has separate clamp bolts other than those which secure the base portion to the bed, hence it is possible to make the cross adjustment without the headstock slipping back.

Another arrangement sometimes fitted, and which is to be recommended, in addition to the clamp bolts, is to have a rack cast up the centre of the bed between the shears, into which drops a catch hinged to the loose headstock. This method gives a better means of taking end pressure when supporting heavy work. The catch of course is provided with a handle to lift it out of engagement with the rack when moving the headstock back.—Pages' Weekly

◆

COMMUTATOR SLOTTING MACHINE EXHAUST SYSTEM.

THE mechanical department of the Nashville Railway and Light Co., Nashville, Tenn., has installed an individual exhaust system in connection with its commutator slotting machine. The system has not only been found desirable for removing the dust from the slotting tool, but has proved profitable because the dust is sold at 8 cents per pound. The amount of dust collected from the slotting necessary with the 150 cars owned by the company produces about $25 annually.

The exhaust system is composed of a No. 0 Sturtevant centrifugal fan, direct driven by a ½-horse-power motor, the exhaust duct extending from the slotting saw to a tank which serves for dust storage.

◆

COATING FOR BELTS.

THE following coating for belts which are to be cemented at the joints is reported by Railway and Locomotive Engineering to be giving satisfactory results:

Take a good glue, add American isinglass equal parts by weight; place the material in a glue pot, and add sufficient water to cover the whole. Let the mixture soak ten hours, then bring the whole to a boiling heat, and add pure tannin until the whole appears like the white of an egg. Apply warm. Buff the grain of the leather where it is to be cemented, rub the joint surfaces solidly together, let it dry for a

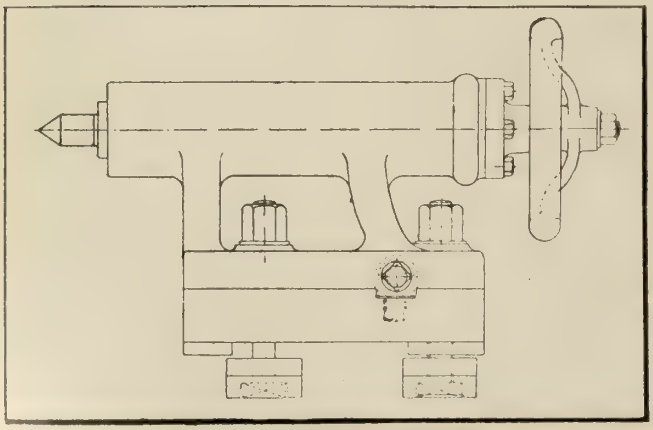

FIG. 1.—LOOSE HEADSTOCKS.

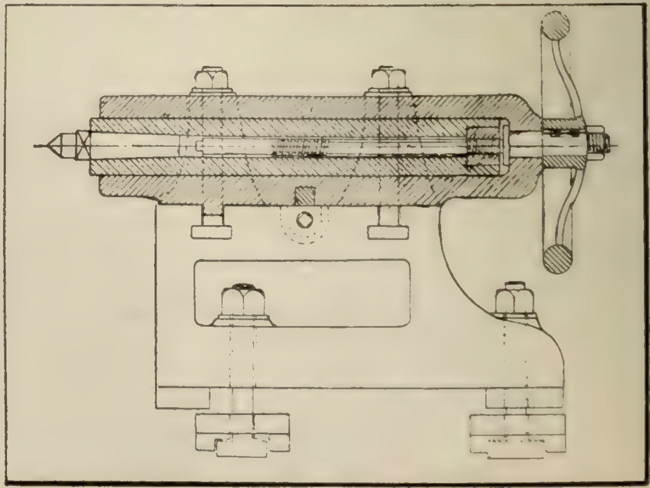

FIG. 2.—LOOSE HEADSTOCKS

few hours, and the belt will be ready for use. Tannin or tannic acid is an astringent substance used in converting hides into leather, and produces a surface on a cemented belt similar to the original leather.

* * *

METALLISING PROCESS.

A FEW years ago, says "Engineering," we noticed a process by Mr. V. Schoop, of Zurich, in which he coated various materials with atomised metals, by forcing a jet of steam or some gas under high pressure through the fused metal, and directing the spray of finely-divided metal, against the surface to be treated. Even paper, fabrics, and celluloid could be coated with liquid metals in this way; but there was difficulty in obtaining cohering coatings, because the finely-divided metal cooled too quickly. In a modification of his process, Schoop, therefore, started from powdered metal and hot gases under a pressure of about three atmospheres. Crucibles, originally required, were dispensed with in the newer process, but the noble metals could not be worked in this way.

Improved Schoop Process.

A further improvement of the Schoop process was recently described by Dr. Lach before the Verein zur Beforderung des Gewerbefleisses at Berlin. In this modification, the metal is used in the shape of a wire or a tape, which issues from a nozzle, and which is surrounded by a flame fusing the wire. The gases, mixtures of oxygen or hydrogen, or of other gases and air, leave the nozzle under high pressure, and carry the fused metal with them. The apparatus is about the size of a heavy revolver, and bears a certain resemblance to it. One tap, turned by hand, admits or cuts off the compressed gas and the air. This compressed gas mixture operates a small turbine, which makes 30,000 revolutions per minute, and sends the gases into the nozzle. The turbine drives a worm gearing which turns the two rolls gripping the wire, and the arrangement is such that the wire-feed keeps pace with the rate at which the wire is being fused.

How the process is worked to yield deposits which either adhere to the object or alloy with it, or which can subsequently be taken off by the reproduction of patterns, was not explained by Dr. Lach, who showed numerous examples demonstrating the wide range of applications to which the process lends itself. Thus pipes and utensils can be coated with tin, lead, or aluminium, inside and outside. When the pressure is low, or the distance large, the metallic particles will unite to a porous conglomerate; accumulator-plates are made in this way. Solid resistance-tapes for electric heaters can, on the other hand, be directly deposited on the insulator.

The utilisation of the process seems to promise well for the purpose of applying anti-corrosion coatings, because the metallic spray will penetrate into crevices and fill up sharp corners, so that a uniform smooth surface, little liable to rusting, is produced. That the process may become a dangerous rival to electric galvanizing, and to electrotyping, will readily be understood. Any object, no matter of what shape, can be galvanized by the spray after having been sand-blasted, and the lecturer showed, among other exhibits, a replica of a picture post-card of Cologne Cathedral, which had been produced by applying a rather sharp pressure in printing the card, so that the pattern came out in relief. A miniature relief map of the Alps was also reproduced in iron, which, it is noteworthy, can also be sprayed by the modified process.

Wood and paper are "bronzed" by the Schoop process, seamless tubes and cigarette mouth-pieces are made by it, and the metallized balloon fabric shown was pliable. That the coatings will in some cases consist rather of the oxide than of the metal may be an advantage. Finely-divided iron would easily rust, for instance, but dry iron oxide is a very stable compound. We should add that Mr. F. Herkenrath has collaborated with Mr. Schoop in developing these metallizing processes.

* * *

HEATING OF CIRCUIT BREAKER CONTACTS.

IN the Electrical World, F. W. Harris points out that a common source of complaint is the heating of the contacts of circuit breakers after the apparatus has been in service for a long period. These breakers, as commonly constructed, have a laminated brush made up of thin leaves of copper, and any temperature over a certain very well-defined maximum will result in the brush becoming soft and losing its elasticity. The heating therefore, becomes very much worse, rapidly approaching a crisis which results in a more or less total ruin of the brush and sometimes a shut-down of the plant.

In a certain case, an examination of conditions showed that the troublesome circuit breakers were connected on a circuit that was never opened, except upon dead short circuit conditions, and these conditions did not obtain more than once or twice a year. The whole trouble was traced to a gradual oxidation of the contacts, and to the fact that the troublesome circuit breakers were never opened and closed to rub off the oxide. It was found that if the breakers were opened and closed a few times on Sundays, it was possible to keep the contacts bright.

* * *

DIESEL ENGINE TROUBLES.

WRITING on "Gas Power Topics" in the columns of the Power User, Mr. W. A. Tookey says that probably the most serious trouble that occurs in Diesel engine operation is the loss of compression pressure due to the wearing of the piston rings and of the cylinder wall. The reversal of the stresses between piston and cylinder that occur during the cycle of operations, due to the side thrusts caused by the angularity of the crank, is responsible for this wear, and it becomes essential to remove the piston, say, once in six months, for the renewal of the piston rings, or at least one or two of them.

When, after several years of work, it has been found, upon measurement, that the cylinder of an engine has become considerably "out of round" it will be recognized that this is an important matter which cannot be neglected. It is for this reason that those who have had experience in the running of Diesel engines would like to see it become common practice for trunk pistons to be abolished in favor of outside crossheads, as in steam engine practice, for then the side thrusts could be compensated for by proper attention being given adjustable slippers and guides, and undue wear of the cylinder and piston rings would be practically things of the past.

* * *

CANADIAN TOOL EXPORTS TO SCOTLAND.

SCOTLAND imports few tools from Canada, and, it would appear after investigation, that the market is well worth consideration. Quantities of small United States tools are in daily use. Among the various classes of machinery imported, agricultural implements are numerous, and it seems that Canadian manufacturers are fully alive to the demand, as many of them are represented in the leading commercial and agricultural centres. The imports at the port of Glasgow alone are valued at approximately $1,000,000 a year.

EDITORIAL ANNOUNCEMENT.

MR. J. H. Williams, who for the past three months has been sojourning in Great Britain and the Continent of Europe, whither he went to recuperate, has returned to his post on the editorial staff of this journal, feeling much improved in health and spirits. His headquarters will be in Montreal, from which point the editorial interests of Canadian Machinery in the Province of Quebec and the Maritime Provinces will be attended to and specially and fully featured.

SCHOOLS FOR MEN.

IN a recent issue of the ''American Machinist,'' an article under the above title from the pen of ''Entropy,'' attracted our attention, and while the necessity has all along existed, although becoming daily more accentuated, it seems somewhat strange that the question of schools or places of education for men has not been given more and earlier prominence. From a considerable experience in teaching subjects relative to mechanical and steam engineering, the lack of and desire for education among men in many sections of industrial activity, were features that it was impossible for us to disregard. Whether we admit it or not, the establishment of technical schools in industrial centres, does not and will not fit the requirement of schools for men, even although, as we are quite well aware that the latter are welcome to avail themselves of all or any of the courses of instruction.

It is not necessarily a man's fault that his education in boyhood, and from thence to manhood, has been neglected; rather, we should say in the majority of cases, has it been his misfortune. The surfeit of education which has always been a feature of schools generally has contributed largely to the lack of real knowledge and learning, because of the tendency to educational nausea, through an application to more or less immature minds, then incapable of absorbing. We have noted in mixed classes (men and youths), of ages ranging from 40 to 15 years, that the greatest difficulty was experienced in conducting these as a combination unit, there being, in spite of a strong desire to get knowledge, a sensitiveness and diffidence so keen as to be felt, on the part of the elders in the presence of those who were 20 to 25 years their junior.

As pointed out by ''Eutropy,'' correspondence schools and the widespread disposition to take advantage of them furnish ample evidence of the desire and inclination on the part of men to acquire in the way of education, what mature years has made them feel both needful and capable of, and if schools for men were even only to assist in aiding the difficulties besetting the adult student in mastering the requirements of a correspondence school course, then the establishment of schools or classes for men would be worth while. It takes pluck, yes, we might call it almost recklessness on the part of men to become a fellow-student, with youths still in their teens, and out of the large number who need and want the instruction, a percentage of those with the dare-devil nature might easily be counted on the fingers of one hand. In the planning of the courses for our technical schools, the feature of classes for men, if schools are unobtainable, would supply a much felt want, and yield results which would not only compare, but might surpass those of budding youth.

* * *

I am not a warm advocate of a lot of foolish, misapplied, maudlin sympathy that has paraded under the name of ''welfare work.'' * * * The welfare work that I believe in, is that which makes it possible for the man to help himself, but it does not include the holding of a milk bottle to his lips after he is weaned.—C. W .Post.

MONTREAL, August 4, 1913.—Generally speaking the machinery and allied markets remain rather quiet, although brokers maintain an optimistic frame of mind. There seems to be a general feeling that relief from the present money stringency will soon be in sight, and that trade will then make a very rapid recovery. Orders are expected shortly for the mechanical equipment of the new technical school at Edmonton, Alta., but outside of this enquiries have been scarce.

Metals.

Pig iron has been quiet for the last three or four weeks, in spite of very low prices. Although the consumption has been about normal, there has been no large buying, foundries contenting themselves with purchasing in a "hand-to-mouth" fashion. The present low prices in Canada are due to strong competition from Buffalo. However, in the United States a decided improvement in tone, with heavier movement, is now taking place, and it is probable that Canadian prices will tend to advance in the near future. Copper is firmer, with a good demand, but the tin and spelter markets continue to show a very weak tone. Lead is still very erratic in sympathy with the violent fluctuations of the London market.

Toronto, Ont., August 5, 1913.—The steel market is often considered a good criterion of the market in general. The rosy complexion taken on by the former during the past week is a good augury for the coming winter. A prominent agent for large American mills said today: "Business is steadier, but not much improved. Mill prices are absolutely firm. Manufacturers see that prices are stiff, and regard this as a good thermometer; consequently they are going ahead with more certainty, and are placing their contracts. Business is much better than three weeks ago. A Canadian dealer verified this statement, adding that he had found business as good during the past week as it was a year ago, and last August with this firm was exceptionally good. Buying is mostly done from warehouse, import trade being quiet. There is a brisk demand for boiler tubes, plates, sheets, angles, and shafting.

General.

A large firm of overhead runway and conveyor manufacturers report that they have more work in hand than usual, and prospects seem good for a continuation of these conditions. Some contracts, however, have been withheld until money conditions are better. A large percentage of their business is done in the West, whence all shipments are made sight draft against B|L. A large oil concern reports an increase in business during the past six months over the same period last year for Eastern Canada. A firm of gear makers have noticed no appreciable drop in business; in fact, July was their largest month for the year. There is a tendency, they say, on the part of the railways to cut their orders down to a minimum. They themselves admit ordering goods in moderate quantities.

Metals.

Business is brisker in metals. Copper advanced half a cent during the week. Consumers seem to be more satisfied with the market, and the biggest trade is being done in copper and tin, the latter selling at a very low level.

❖

NATIONAL STEEL CAR WORKS.

A REPORT from Hamilton, which is believed to be correct, states that the Hamilton Steel Car Works of that city is now producing an average of 20 cars a day. The outlook is thought to be particularly bright, as orders are sufficient to keep the company operating at this rate till well into the autumn.

❖

George Smith, formerly chief engineer for Lindsay, has been appointed chief Engineer for Midland, Ont.

American Automobiles.—Automobiles and automobile parts to the value of $40,000,000 were shipped from the United States in the past fiscal year, as against $1,000,000 worth in 1903. Canada was the largest buyer, having taken 7,200 cars valued at $9,200,000. England bought almost 4,000, valued at $3,000,000.

CANADIAN CAR AND FOUNDRY.

WHILE it is early yet to foretell with any degree of accuracy what the earnings of Canadian Car and Foundry Co. will be for the year ending September 30th, we understand that the next annual statement will show large increases in both net and gross earnings. Sales for the nine months' period just ended have been greatly in excess of last year, the three-quarter year's showing being little short of the entire year's business last year. Profits, too, have been good; and if the remaining three months are up to the averages, this year will come out a long way ahead of any other in the company's history.

Work on the Fort William plant is progressing favorably and the plant will be ready for operation by about the time navigation opens in the spring. The plant, irrespective of working capital will cost about $1,500,000 and will have a capacity of about 40 cars a day.

DRYDEN TIMBER & POWER CO.

THE Dryden Observer and Star published a very interesting description of the works of the Dryden Timber and Power Plant, which was completed last spring at a cost of $1,000,000. The mill is equipped with 140-inch board machines, having 40 driers, triple deck and two cylinder moulds. The buildings cover an area of 100,000 square feet. There are four digesters, each of 10 cords capacity. The boiler house is equipped with eight 22-horse-power Jenckes tubular boilers, and the machinery is all motor-driven from Hydro power. The power house contains two turbine units of 950-horse-power each, direct communicated to two 750 K. V. A. generators. Power is supplied by a dam 140 feet long across the Wabigoon River.

The company's timber limits consists of 250 square miles along the Wabigoon Lake. The total outlay for the plant, including the Hydro development, is more than $1,000,000. The capacity of the mill is 40 tons per day.

The company when organized in 1911 took over the assets of the Gordon Pulp and Paper Company, including timber limits, water rights, grounds, land, buildings and chattels.

The directors of the concern are Messrs. D. L. Mather, D. W. Bonfield, Willis Chitty, Francis Gibbs, S. Nesbitt, H. B. Shaw, G. A. Kingston. D. L. Mather is president.

NOVA SCOTIA STEEL AND COAL CO. OUTPUT.

SO far as the Nova Scotia Steel & Coal Co. output is concerned, the outputs for the present year are in excess of any previous half-year in the history of the company.

The following is a comparative statement of the outputs for the first half year in 1912 and 1913:

	1912.	1913.
Coal shipped	322,716	327,221
Coke made	39,630	53,253
Pig iron	24,930	40,043
Ingots	33,598	38,355
Finished material	31,899	33,625
Axles made	22,783	27,503
Total ore mined	248,450	271,911
Submarine ore mined.	17,327	127,211
Ore shipped	94,620	151,033
Limestone	26,792	34,579

MOTORS FOR REVERSING ROLLING MILLS.

A GERMAN firm is now building single motors for driving reversing rolling mills, with outputs up to 15,000 horse-power. One of the difficulties to be met was that, owing to the necessity of keeping the diameter of the armature as small as possible, unsatisfactory cooling conditions were set up. After many experiments, the firm has now definitely adopted the plan of cooling such motors by means of compressed air drawn from the outside. The stator is covered in on the opposite side to the commutator, except for a few small openings, the rotor being closed on the commutator side. The cooling air, which is led to the motor through filters by means of special fans, enters through an aperture in the neighborhood of the shaft, whence it follows a predetermined course. Part of the air is forced through the core slots, part through the openings in the motor covering, to cool the commutator, while the remainder is driven through the stator coils or through the air gap between the rotor and stator.

LONG SAULT POWER.

THE Hon. Clifford Sifton is revising the engineers' report of the Conservation Commission on the Long Sault dam project. From an engineering standpoint the dam is feasible, although it is believed that there will always be some risk as regards flooding. However, in spite of this latter danger it is thought better that power be developed on the Canadian as well as upon the United States side. The Commission is in favor of the State rather than a private corporation taking up the necessary development work. It is expected that this development work will mean serious interference with navigation on the St. Lawrence.

TORONTO VIADUCT.

WORD has been received by G. R. Geary, corporation counsel, that the Dominion Railway Board has approved of the plans and profiles for the new Toronto viaduct agreed upon between the city, the railway companies, and the Harbor Commissioners, after lengthy negotiations, and has ordered that the work be completed by July 29th, 1916.

LAKE SUPERIOR CORPORATION.

ACCORDING to an unofficial announcement, remarkable progress in earnings is being shown by the Lake Superior Corporation and its subsidiary companies.

The net earnings for the month of May, amounting to $270,339, before allowing interest, are said to show an increase of $104,308, as compared with May, 1912, a gain of no less than 63.2 per cent.

The showing made in the eleven months to the end of May, it is further added, reveals a yet larger proportion of increase, the net earnings being $2,108,943, against $1,194,558, a gain of $914,385, or 76.5 per cent.

Miscellaneous

E. F. Bradley has been appointed manager of the Toronto office of the International Engineering Works, Ltd.

K. S. MacLachlan, B.A.Sc., was recently appointed superintendent of the Metals Chemical Co., Welland, Ont., ore smelters and refiners.

C. P. R. Angus Shops.—Commencing August 1, the working hours at the Angus shops of the C. P. R., Montreal, were reduced from fifty-four to forty hours per week. This is in accordance with an agreement with the Federated Trades.

A. K. Beauvais, foreman for the Dominion Bridge Co., Montreal, which has the contract for the steel superstructure of the buildings of the Atlantic Sugar Refineries, Ltd., at St. John, N.B., has arrived on the job. Mr. Beauvais is one of the few survivors of the Quebec Bridge disaster, August 30, 1907.

Chatham, Ont.—During the month of July, Customs receipts at the port of Chatham total $41,271.59, which is over thirteen thousand more than for July, 1912. Almost every sub-port in the district shows an increase for the month. The local collector, D. R. Farquharson, is authority for the statement that this is a record for collections here.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Regina, Sask.—It is reported that the Brand Stove Co. will erect a factory at a cost of about $100,000.

Toronto, Ont.—The roof of the Greey Foundry Co. plant was burned on Aug. 1 by a spark from the cupola.

Hull, Que.—The A. H. Coplan Co., Ottawa, will locate a foundry in this city. The estimated cost is $50,000.

Port Arthur, Ont.—W. Foote has commenced work on the excavation for a garage to cost $20,000, two storeys high.

Hamilton, Ont.—A factory and warehouse will be erected by the Otis Fensom Elevator Co. Architects, Stewart and Witton.

Dundas, Ont.—The ratepayers passed the by-law providing for the guarantee of $15,000 bonds of the Canadian Abrasive Wheels, Ltd.

Levis, Que.—La Fonderie De Levis has recently been opened by P. A. Beaulieu for making iron, brass, copper and aluminum castings, and for jobbing work.

Woodstock, Ont.—Robert S. Bickle, of Winnipeg, will instal a plant for the manufacture of fire fighting apparatus in the old auto factory here. According to the present plans, the Webb Motor Co., of Allantown, Penna., will join in this enterprise, building motor fire apparatus of all kinds and commercial cars.

Levis, Que.—The plant of the Canadian General and Shoe Machinery Co., Ltd., which went into liquidation several months ago is being operated temporarily by G. T. Davie & Sons, shipbuilders, Levis, who took over the business by permission of the court after asking leave to finish the contracts for machinery, pumps, fittings, etc., for Hopper Barge No. 1, which is being built by Davie for the Department of Marine and Fisheries.

Fort William, Ont.—The city is advertising for tenders for an addition to the street car barn on Walsh Street. The addition is to be of brick, 260 feet long, 30 feet wide, and 30 feet high, and it is the intention to have it completed about September 1, when Fort William takes over its half of the Port Arthur and Fort William Street railway. It will be used entirely for a repair and machine shop. There will be departments for painting and carpentering. It is estimated that it will cost to build between $25,000 and $30,000.

Welland, Ont.—The citizens, by a majority of 366, carried a by-law, on August 4, granting a stated rate of taxation to the Electric Steel and Metals Co. This company has secured property in Ward Five, signed a contract for several thousand electric horse-power, and will erect a plant where it expects to employ 250 men. No other concessions were asked. The company will melt iron and steel by electricity, making only the higher grades. Plans are being drawn for various buildings, and it is expected that construction will be started soon.

Plessissville, Que.—La Fonderie de Plessissville whose plant was burned to the ground some months ago, have built a new plant consisting of machine shop, foundry and boiler shop, paint and pattern shop. It is practically a duplicate of the old plant, and is situated near the G.T.R. station: the other was situated in the village. It measures 400 by 50 feet.

Electrical

Russell, Man.—S. D. Sparrow is the general contractor for an $18,000 electric light plant to be installed here.

Montreal, Que.—A fire in the main office of the Bell Telephone Co., July 30th, put 7,000 main telephones out of business.

St. Catharines, Ont.—On August 28 the ratepayers of St. Catharines will vote upon the question of taking a supply of Hydro-Electric power.

Vancouver, B.C.—At a meeting of the Ratepayers' Central Executive on July 21 consideration was given a campaign for the establishment of a municipal electric light and power plant. Kerrisdale Association has asked that the scheme be enlarged to include the neighboring municipalities.

Stratford, Ont.—C. T. McAllister, representing United States capital, says that the people he represents have definitely decided to build two electric roads to Grand Bend, one from Stratford and one from London. The charter for the London-Grand Bend line has already been acquired.

Toronto, Ont.—The Hydro-Electric Commission of Ontario have decided to enlarge the power house at Niagara Falls, and to double the line between Dundas and the Falls. This will provide the necessary equipment for the line between London and Dundas, towers for which are already erected. This work will cost $300,000.

Orillia, Ont.—An agreement has been reached between the Minister of Railways and Canals and the members of the Orillia Water, Light and Power Commission, under which the department undertakes to build a new dam and power house, a mile and a half below the town's present plant on Ragged Rapids. This will cost the Government $112,000. The town will provide the new machinery for 3,500 h.p., the cost of which is estimated at $70,000.

General Industrial

Sorel, Que.—Pontbriand & Son are planning to erect an automobile factory at Maisonneuve, Montreal, Que., two storeys, of brick and steel.

Quebec, Que.—The plant of the Canadian Packing Co., Fourth St., Limoilou, Que., recently destroyed by fire, will be rebuilt and new machinery installed.

Montreal, Que.—Damage amounting to between $5,000 and $10,000 was caused by a fire which destroyed the plant of the Sovereign Lime Co., on Delorimier Avenue, above the C. P. R. tracks, on July 25. A. N. Tessier, manager.

Welland, Ont.—The Empire Cotton Mills are nearly completed. The main mill is 280 feet by 120 feet, two storeys high; weave shed 231 feet by 249 feet; warehouse 350 feet by 100 feet, and several smaller buildings. Electricity will be used throughout, 1,000 h.p. being used by the motors.

Calgary, Alta.—In an effort to encourage the packing industry of the West and to centralize the business in Calgary, the municipality will probably purchase 60 acres of land adjoining the city limits and exploit a comprehensive scheme looking to the development of the meat packing industry. The city has taken an option on the land at $360,000.

Municipal

Watrous, Sask.—The town has sold $35,000 worth of debentures for waterworks and $35,000 for sewerage.

Medicine Hat, Alta.—A new motor driven hose truck, built by the Webb Co., of Allentown, Pa., has been delivered. It cost $7.500.

Stratford, Ont.—The city may spend $20,000 on new fire equipment, including steam engine, hook and ladder truck, chemical engine and hose wagon. Fire Chief Kappele.

St. Catharines, Ont.—The ratepayers have voted favorably on a by-law to grant a site worth $2,000 to the Canadian Flax Mills, Ltd., which has already commenced work on a factory to employ 200 hands.

Trade Gossip

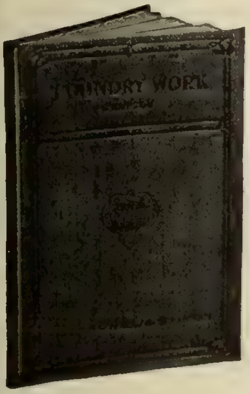
Montreal, Que.—The Customs returns for July, 1913, $2,529,201, constitute a new record in the history of the port, showing an increase of $277,542.55 over the returns for the corresponding month of 1912, and an increase of $133,124.57 over the previous record, which was made in May of this year.

Nova Scotia Steel & Coal Co.—The output of the Nova Scotia Steel & Coal Co. for the month of July was as follows:—Coal mined, 69,600 tons; pig iron, 7,100 tons; steel ingots, 7,500 tons; ore mined, 53,600 tons. The ore shipments for the month were the largest in the history of the company, amounting to 115,000 tons.

B. F. Sturtevant Co.—We are officially informed that the B. F. Sturtevant Co., of Canada, Ltd., have arranged for a plant in Galt, Ont., from which the company will handle all business in Canada, and also export to England, Australia, and other foreign countries. The property in question is such that the manufacturing and assembling of the more important lines as manufactured by the B. F. Sturtevant Co., of Boston, can be started almost immediately. Arrangements have been made to provide for a growth up to 10 acres, as arranging for this plant, and incorporating in Canada means a development of the blower business in Canada on the same large scale as has been accomplished in the United States. Salesmen are already located to cover Montreal, Toronto and Vancouver sections, and offices will soon be established in each principal city of Canada. The manufacturing, engineering and sales will be handled by men trained by the company in Boston, and the general policy of manufacturing high-grade material for the best class of trade will be carried out. Some of the more important apparatus which will be built are fans and blowers, planing mill exhausters, propeller fans, heating and ventilating apparatus, fuel economizers, mechanical draft, steam turbines, vertical engines, generating sets and stokers.

You May Have This Book Without Spending a Cent

if you are a subscriber to "Canadian Foundryman," by sending in to us four new paid-up subscriptions. If you are not a subscriber send in your own, along with the proper number of paid-up subscriptions and the book is yours.



Foundry Work

By Wm. C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with four yearly paid-up subscriptions.

The subscription price is fifty cents per year; two years for one dollar.

SECOND HAND MACHINERY FOR SALE

JUST AS YOU were attracted by the Caption "Second Hand Machinery for Sale," so will hundreds of other men all over Canada.

WHY NOT ADVERTISE that machine of yours that is getting too small or that isn't quite suited to the work for which it was intended?

Let "CANADIAN MACHINERY" find a buyer for your machinery or let it find you a second hand machine if you need one. Let "CANADIAN MACHINERY" connect you with good men if you are looking for them or with a better job if you desrve one.

Let it sell for you or buy for you, be it a factory or a machine, a man or a job.

"CANADIAN MACHINERY" is the Market Place for Machinery and Metal Men. Come to it if you wish to buy or sell.

Rates for a stand in the Market Place are 2c per word first insertion, 1c per word each subsequent insertion. Each figure counts as one word.

CANADIAN MACHINERY
143 University Ave., Toronto

Personal

Edmund Bristol,, M.P., and Grant Morden have retired in favor of J. M. Norcross, of Toronto, and J. P. Steedman, of Hamilton, from the Richelieu directorate.

Frank Powers has been appointed foreman of the polishing, buffing and nickel-plating department of the Sarnia, Ont., plant of the H. Mueller Mfg. Co., Decatur, Ill.

W. E. Edestrand, vice-president and general manager of the Welland Machine and Foundries, left last week for a trip to the Western States on business and pleasure combined.

Catalogues

The Department of Marine and Fisheries, Ottawa, have published a list of lights and fog signals on the inland waters of the Dominion.

The Department of Trade and Commerce, Ottawa, have published a report for the fiscal year ending March 31st, 1912. Part 1 is devoted to imports and exports.

The Department of Marine and Fisheries, Ottawa, have published a list of lights and fog signals on the Atlantic Coast, including the Gulf of St. Lawrence to head of ocean navigation.

The University of Illinois have published Bulletin No. 67, devoted to reinforced concrete wall footings and column footings. Copies may be had by writing the University Experimental Station, Urbana, Ill.

The Van Dorn Electric Tool Co., Cleveland, Ohio, have sent us a copy of pamphlet describing their "V.D." hard service electrically-operated drilling machines, grinders, etc. The various types are carefully described and illustrated. Copies may be had by writing the Canadian agent, R. E. T. Pringle, Toronto.

The Canadian Mathews Gravity Carrier Co., Ltd., Toronto, have sent us several pamphlets descriptive of the carriers and automatic elevators which they manufacture. Particulars are given of the equipment and several illustrations of carriers and elevators installed in brick plants, lumber yards and all kinds of factories, showing the many uses to which this class of equipment can be put. Copies will be gladly sent to interested readers.

The Buffalo Forge Co., Buffalo, N.Y., have sent us a copy of Catalog No. 250, which is descriptive of the "Buffalo" mill exhausters. Particulars and velocity tables are given for various types and sizes of fans. Several illustrations are given showing installations of exhaust systems. The catalog also contains some useful engineering data suitable for this class of work. Copies may be had by writing the company in Buffalo, or the Canadian Buffalo Forge Co., Ltd., Montreal.

The Standard Electric Tool Co., Cincinnati, Ohio, have published Bulletin U8, which describes the "standard"

high power universal electric drills. These drills are made in several types for D. C. or single phase alternating current. A general description is given with capacities of each type. Copies of this bulletin will be sent on request.

Tate, Jones & Co., Inc., Pittsburgh, Pa., have sent us a copy of circular No. 142 which is entitled "Fuel Oil Data." The circular contains illustrations and descriptions of various types of oil heated furnaces, also much valuable information on the subject of fuel oil, especially with regard to its application for heating furnaces. Copies may be had on request.

E. Brant, 96 Victoria St., London, Eng., has sent us a catalog of wire drawing machines, also a descriptive leaflet on wire annealing with special reference to "Lammine Pots" for cleaning or pickling wire. The wire drawing machines are fully illustrated and described, a brief specification is also given. Copies of the above and particulars regarding wire machinery of all kinds can be obtained by writing.

The Canadian Allis-Chalmers Co., Toronto, have sent us a copy of bulletin No. 4032 describing the "Allis-Chalmers" friction clutch coupling and clutch pulley. Each type is fully illustrated, and tables giving the principal dimensions of each size and type are included. Some interesting data is given showing the information that should be sent in when ordering this equipment. Copies of this bulletin will be gladly sent to interested readers.

The Standard Machinery Co., Providence, R. I., have sent us a copy of their catalog describing the various lines of machinery which they manufacture. This catalog, which is the ninth edition, contains particulars of wire coilers, draw benches, tubbing machines, adjustable draw plates, etc. Each machine is illustrated and fully described, also a brief specification is given. Copies will be sent to interested readers.

Bruce, Peebles & Co., Ltd Edinburgh, Scotland, have sent us a copy of pamphlet No. 20C, which has been revised and brought up-to-date. The pamphlet describes fully the "Peebles" converters especially with regard to the principle of operation and general design showing their suitability for traction or lighting purposes. Several illustrations are given of large plants where these converters have been installed. A table is included giving comparisons of motor converters with rotaries and motor generators. Copies of this pamphlet may be had on request.

Classified Advertisements

¶ Those who wish to sell or buy a business, obtain competent help, connect with satisfactory positions, or secure aid in starting new enterprises should not fail to use the Want Ad. Page of "CANADIAN MACHINERY."

¶ If you want to sell or buy a second-hand lathe, planer or any other shop equipment, let "CANADIAN MACHINERY" pick out a seller or buyer for you. How about that second-hand engine or boiler which you would like to dispose of?

¶ "CANADIAN MACHINERY" is the central market place of the machinery trades throughout Canada.

¶ There is always some one looking for just such proposition as you have to offer.

Rates (payable in advance):—2c per word first insertion, 1c per word subsequent insertion, 5c additional each insertion when Box Number is required. Each figure counts as one word.

Buy Where Buying's Good

¶ When you open "CANADIAN MACHINERY" you have come upon a most remarkable community of machinery manufacturers.

¶ You have entered a great Machinery Market Place where admission is by quality. A Market Place where those who sell are essentially progressive and those who buy invariably well pleased.

¶ It will pay you to do your buying here, where buying's good.

Use Canadian Machinery's
Directory in doing your buying

Exhausters.

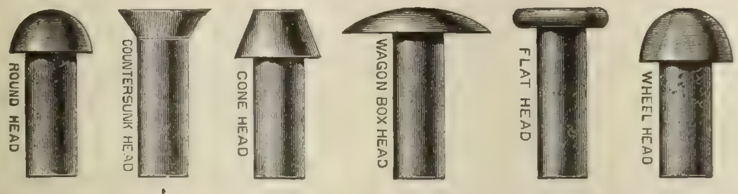
CRANES

All kinds and sizes for all purposes. Detailed specifications and prices upon request.

John T. Hepburn, Crane Builder, Iron Founder and Machinist
18-40 Van Horne St., Toronto, Can.



We manufacture Rivets of every description, ½ inch dia. and smaller.

PARMENTER & BULLOCH CO., LTD.
GANANOQUE, ONT.

High-Speed Steam-Hydraulic Forging Presses

Double your production with one-half your labor cost and steam consumption. Cost of repairs reduced. Eliminates heavy shocks and vibration.

"SINGLE LEVER CONTROL"

Small sizes—single-frame type. Large sizes—four-column type.
Built for doing all classes of forging, shearing or pressing

100 Tons to 12,000 Tons Capacity

UNITED ENGINEERING & FOUNDRY CO.

2305 Farmers Bank Building, PITTSBURG, PA

EXCLUSIVE MANUFACTURERS FOR UNITED STATES, CANADA AND MEXICO
Manufactured under Davy Bros., Ltd., Patents.

THE
Steel Company of Canada
LIMITED

PRODUCERS OF
PIG IRON
Foundry Basic Malleable

Bar Iron **Bar Steel**

Plain Bars and Twisted Squares for reinforcement of Concrete

Bolts and Nuts, Tacks, Screws, Wire Nails, Rivets, Wire

Immediate Shipment all Standard Sizes
Prompt Attention to Orders for Special Sizes

Wrought Pipe, Bale Ties, Lead, R. R. Track Equipment, Field Fencing

A Valuable New Book on an Important Trade

PATTERN-MAKING

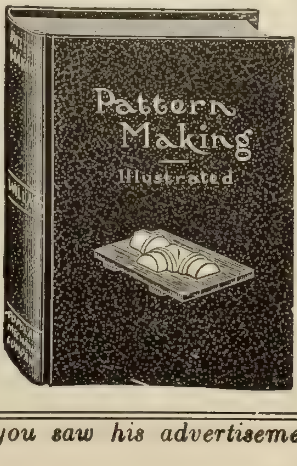
By G. H. WILLARD

Two Significant Opinions:

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co., Wilmington, Delaware.

224 Pages. 312 Illustrations. Cloth Cover.



With Additional Chapters on Core-Making and Molding

"WRITTEN SO YOU CAN UNDERSTAND IT."
